MADRAS:

PRINTED BY THE SUPERINTENDENT, GOVERNMENT PRESS.

1895.

PREFACE.

This volume has been compiled under some difficulties, as there was no complete manual available for reference and assistance. I have, however, received considerable help from the Honorable Mr. Sturrock, the author of the first volume, and the Collector of the district has kindly had all the proofs examined in his office.

I take this opportunity of according my best thanks to Diwan Bahadur P. Rájaratna Mudaliar, Secretary to the Board of Revenue (Settlement Department), for the statement showing the nature of the season for a series of years; to the Director of Public Instruction for the special statistics of education; to the various tahsildars of the district for information regarding occupations; to Mr. A. M. Slight, Head Assistant Collector of the district, and to the Collector's sheristadar for notes on the economic condition of the people; and to the Superintendent of the Government Press for his ready courtesy and advice in connection with the printing of the volume.

H. A. STUART.

OF THE

SOUTH CANARA DISTRICT.

CHAPTER I.

AREA AND POPULATION.

Statement showing the Area, Population and Divisional Charges.

CHAP. I.

AREA AND

ADMINISTRATIVE

DIVISIONS.

Taluk			Area in square miles.	Population according to the census of 1891.	Designation of Divisional Officer and his head-quarter station.
Mangalore			620	278,908	Deputy Collector (Mangalore).
Coondapoor Udipi		:	512 787	120,268 253,717	Head Assistant Collictor (Coondapoor).
	TOTAL		1,299	373,985	
Kásaragód Uppinangadi	•••		1,032 951	280,659 118,807	Deputy Collector (Puttúr).
	TOTAL		1,983	399,466	
Amindivi Islan	ds	•••	•	3,722	
Gran	d Total		3,902	1,056,081	

The area of the South Canara district is 3,902 square miles, and there are only five districts in the presidency of a smaller extent. It consists of five Government taluks, and a small group of islands in the Indian Ocean, known as the Amindivis, is also attached to it. The area of these islands has not been ascertained by the Survey department. Kásaragód is the largest taluk and has also the greatest population. The district is divided, for purposes of revenue administration, into three charges or divisions, each charge being under the direct control of a Divisional officer. The Puttúr Deputy Collector's charge, which consists of the taluks of Kásaragód and Uppinangadi, is the largest of the three both in area and in population. The Head Assistant Collector's division is

CHAP. I. much smaller in extent, but it has nearly as many inhabitants.

The head-quarter Deputy Collector's division is placed in charge of the Assistant Collector, when there is one of sufficient studinag.

POPULATION. Statement showing the Variation in Population between 1881 and 1891.

. Taluk.	1891.	1881.	Increase.	Percent- age of increase.	Percentage of increase between 1871 and 1881.

Kásaragód	280,659	243,881	36,778	15.08	9.57
Mangalore	278,908	249,049	29,859	11.99	4.10 *
Udipi	253,717	237,432	16,285	6.86	2.53
Uppinangadi	118,807	110,367	8,440	7.65	2.46 *
Total	1,056,081	959,514	96,567	10.06	4.48

* Including Amindivi Islands. •

The early censuses of Canara cannot be utilized here, as the district then included what is now North Canara, and the figures cannot be separated until the census of 1866, when the population was 839,688. At the census of 1871 it had risen to 918,362 and in 1881 it was 959,514.

The population of South Canara on the 26th February 1891 was 1,056,081, and there are only five districts in the presidency which have a smaller population. Of the several taluks in the district, Kásaragód contains the highest number (280,659) of inhabitants. Mangalore comes next and Udipi follows close. Uppinangadi has the smallest number of inhabitants, though it is much larger in extent than either Mangalore or Udipi.

The population of the district has increased since 1881 by 96,567 or 10.06 per cent. This is equivalent to an annual increment of 0.96 per cent. Between 1871 and 1881 the population increased by only 4.48 per cent.; this low rate of increase must be ascribed to the great famine, for though South Canara is outside the actual famine area, yet the effect of high prices would be felt there. As regards the decade 1881–1891, South Canara shows a lower rate of increase than most districts. The average for the presidency is 15.58, but for the non-famine districts it is only 12.85 per cent. In the neighbouring district of Malabar the advance was 12.16 per cent., but in North Canara it was only 5.81 per cent.

The rate of increase varied a good deal in the different taluks, ranging from 15.08 per cent. in Kásaragód to 1.36 per cent. in the Amindivi Islands. The population of the latter, however, is small, and the absence of a few hundred sailors would affect the percentage considerably. Of the actual taluks, Coondapoor shows an

increase of only 4.48 per cent., and this approximates to the rate of advance in the adjoining district of North Canara. The rate POPULATION. of increase advances as we go south, attaining the maximum in Kásaragód. Assuming the rate of increase in the current decade to be the same as in the past, the population on the 26th February of each year will be as follows :-

Year.	Population.	Year.	Population.
1892	1,066,230	1897	1,118,470
1893	1,076,480	1898	1 100 000
1894 .,	1,086,830	1899	1,140,080
1895	1,097,280	1900 .:	1,151,040
1896	1,107,820	1901	1,162,100

There are 271 persons to the square mile, the average for the

DENSITY.

Statement showing the Density of each taluk.

Taluk.	Number of persons to the square mile.
Coondapoor .	235
Kásaragód .	272
Mangalore .	450
Udipi	322
Uppinangadi .	125
Total .	271

presidency, exclusive of Agency Tracts, being 281. density is highest in Mangalore, and it is fairly high in Udipi. It is lowest in Uppinangadi, and this is due to the fact that more than one-half of the taluk is covered with forest. Taking the district as a whole, there are 2.36 acres to each inhabitant, the average for the presidency being 2.27 acres. In Ponnáni and Kumbakónam, which are the most densely populated taluks in the

whole presidency, the extent of land available for each individual is only about half an acre. The question of the pressure of the people on the agricultural land is discussed in Chapter IX.

Statement showing the number of Occupied Houses.

Taluk.	Number of occupied houses.	Average number of inmates per occu- pied house.
Amindivi Is- lands.	827	4:50
Coondapoor	22,266	5:40
Kásaragód	50,890	5.52
Mangalore	48,982	5.69
Udipi	45,116	5.62
Uppinangadi	21,503	5.23
Total	189,584	5.57

The total number of occupied houses is 189,584, and there are on an average 5.57 persons to each house, the average for the presidency being 5.31. The statistics for the different taluks do not present any striking differences. In the Amindivi Islands, however, there are only 4.50 inmates to each house. The subjoined statement shows the nature of the roofs of houses and other buildings, such as schools, shops, temples, cart-stands, &c.

HOUSES.

CHAP. I. Houses.

	Tiled.	Terraced.	Thatched.	Total.	Percent- age of thatched.
Houses (occupied and unoccupied).	5,438	2	190,214	195,654	97:22
Other buildings	3,114	12	28,122	31,248	90 -0 0
Total	* 8,552*	14	218,836	226,902	96.22

Thatched houses form 97.22 per cent. of the total number of dwellings, while the proportion in 1871 was nearly 99 per cent. There has thus been a slight improvement in the twenty years. It should be explained, however, that the statistics of 1871 relate to occupied houses only, while those of 1891 include all dwelling houses whether occupied or not; and, as unoccupied houses are generally inferior buildings, it follows that the improvement is really greater than that indicated by the above figures. Thatched houses are much more common on the west coast of the presidency than elsewhere, but this fact, by no means, indicates want of wealth. In Bellary and Anantapur, for example, only 28 per cent. of the houses are thatched, while in Malabar and Canara the proportion is 97 per cent.; yet the latter districts are most certainly richer than the former. The great preponderance of thatched houses on the west coast is largely due to the custom which reserved that kind of roof for temples and the dwellings of Bráhmans. As this restriction becomes relaxed, we may expect a large addition to the number of tiled buildings, for there is a considerable local industry in the manufacture of tiles.

The annexed table gives the detailed statistics for each taluk and municipality.

CHAP. I.

Statement showing the Population of Towns. -

Town.	Popul	ation.	Variation.	Percent- age of
10,111	1891.	1881.		variation.
Mangalore	40,922	32,099	+ 8,823	+ 27:49
Udipi	7,272			•••

There are only two towns in the district, viz., Mangalore and Udipi. The former contained 40,922 inhabitants in 1891 and the latter 7,272. Since 1881 the population of Mangalore has increased by 27.49 per cent., or at a rate considerably higher than that for the whole district. The limits of Udipi have been changed since 1881, and the exact population enumerated in that year within the present limits is not known. Mangalore is the port not only of the district, but also of a part of Mysore and Coorg, from which places it receives coffee for shipment to Europe. The Basel Lutheran Mission has established weaving and tile factories in the town, and in the latter industry the missionaries have had local imitators. These industries have no doubt attracted population from the rural districts and the high rate of increase must be ascribed in part to this cause.

The urban population of the district is 48,194 or 4.56 per cent. of the total, which is less than the proportion in any other district. The average for the whole presidency is 9.56 per cent. Statistics of the religion of the urban population are given in Chapter II.

VILLAGES.

The total number of inhabited villages is 1,286, and there are five uninhabited. It must be remembered in considering these statistics that a village in Canara simply means the area lying within certain limits and does not necessarily connote any cluster of houses; for in Canara as in Malabar the population chiefly live on their homesteads, and there are but few collections of dwellings so close together as to constitute a street.

The distribution of the inhabited villages, according to population groups, is shown in the following statement:—

CHAP. I. VILLAGES.

CHAP. I.

Immigration

AND

Emigration.

The statistics of birth-place collected at the census are useful in determining the extent of migration to and from each district. *There is very little immigration into South Canara, for no less than 98.92 per cent. of the people enumerated in the district were born in it. Of the immigrants, 6,658, or 0.63 per cent. of the total population, are from adjoining districts or states, and we thus have 99.55 per cent. of the population returned as born in the district or in adjoining tracts. The proportion of the population born in remote districts of the presidency, or in other parts of India, is 0.43 per cent., which leaves only 0.02 per cent. as coming from other countries. The statistics of emigrants from South Canara are not complete as the returns of Mysore and other provinces and states, except Coorg, do not give information for any smaller area than the province as a whole. Taking, however, the figures that are available, we find that 15,616 natives of South Canara were enumerated in other districts or states of Madras or in Coorg. Of these 13,733, or about 88 per cent., were enumerated in the adjoining districts or states, as many as 12,432 being found in Coorg alone. This little province sends to South Canara only 162 individuals, so that there is some real migration from South Canara into Coorg. Among the emigrants, males preponderate, which shows clearly that the emigration is one of labour. The majority of these are labourers on the coffee plantations in Coorg, and they return to their native villages every year after the crop is taken. . We may, therefore, conclude that there is hardly any immigration into South Canara, but that there is a slight emigration of a temporary character into the adjacent province of Coorg. This emigration is probably greater than appears from the figures, as the coffee season of 1891 was an early one and many of the labourers had returned to their homes before the date of the census.

CHAPTER II.

RELIGION: CASTE AND LANGUAGE.

THE annexed table shows the distribution of the population in each taluk according to religion. Taking the district as a whole. 81.68 per cent. are Hindus and 10.60 per cent. are Musalmans. Statistics of Christians form 6.75 per cent. of the total population, while the Religion. proportion of Jains is slightly under one per cent. South Canara contains a much lower proportion of Hindus than any other district except Malabar, while the proportion of Musalmans is higher only in Kurnool, Madras and Malabar. Christianity has been long established in this district, and its adherents are numerous, no less than 71.259 persons being followers of this faith. Only three districts— Tanjore, Madura and Tinnevelly-contain a larger number of More than one-third of the Jains of the presidency are found in South Canara. There are 67 persons under the head of 'others,' of whom 48 are Brahmos, 15 are Pársis and 3 are The remaining one individual made no return of his religion. The proportions in the different taluks present striking differences. The inhabitants of the Amindivi Islands are all followers of the faith of Islam. Elsewhere the Hindus largely predominate; the proportion is lowest in Kásaragód and Mangalore, and in the former the Musalmans form 20.21 per cent., while the proportion of Christians in the latter is as high as 14.93 per cent. Kásaragód borders closely on Malabar, and Mangalere contains the head-quarters of more than one mission. In the Coendapoor taluk, on the other hand, which is farthest removed from Malabar, nearly 93 per cent. of the people belong to the Hindu religion. Jains are found in every taluk of South Canara except the Amindivi Islands, but their numbers are large only in Mangalore, Udipi and Uppinangadi.

The Hindus have not increased so fast as the total population.

Increase per cent. since 188	31.
Hindus	8.17
Musalmans*	19.57
Christians	22.41
Jains	1.54
TOTAL POPULATION	10.06

and this is no doubt partly due to the fact that they are relatively Statistics of most numerous in those taluks in Religion. which the general rate of increase was lowest; but there can be little doubt that they have also lost some of their number through con-

version to Islám or Christianity, for the followers of these two faiths have advanced at a much higher rate than the rest of the population. This question is discussed in the Madras Census Report of 1891, and the conclusion there arrived at is that some 4,000 Hindus were converted to the creed of Muhammad during the ten years. The conversions to Christianity may be put at between 4,000 and 5,000. The Jains have hardly advanced at all: this fact suggests the conclusion that they are gradually forsaking their religion for Hinduism or Christianity.

The Hindus in South Canara are mostly members of the Saiva Sects of The Vaishnavites constitute only 11 per cent. and the Madhvas 4 per cent. The proportion of the latter sect, however, is the highest in the presidency, and the district also contains the largest absolute number of Mádhvas. The town of Udipi contains their chief math.

Sects of Hindus.

Sect.	Total.	Males.	Females.	Percent- age.
Saivites	720,295	346,953	373,342	83.21
Vaishnavites	97,621	45,590	52,031	11.32
Mádhyas	35,151	17,404	17,747	4.07
Lingávats	701	427	274	0.08
Others (including not stated)	8,805	3,751	5,054	1.02
Total	862,573	414,125	448,448	100.00

The progress made by each of these sects during the last two decades cannot be determined with any degree of accuracy, as a very large number of Hindus did not return their sect at the two earlier enumerations. Of the 8,805 persons who appear under the head of 'others' 992 made no return of sect; of the remainder, 7,653 persons have returned their sect (or had it returned for them) as Bhútárádhikas or devil-worshippers, 41 are Sáktis, 81 have returned their caste name as their sect, and 38 are said to be Daivárádhikas or worshippers of god. If devil-worship were to be accepted as a

CHAP. II. RELIGION.

Sects of Christians. sect, it would include fully three-fourths of the population of the district, for the Bhútas play a much more important part in the religious life of the people than do Siva and Vishnu.

The subjoined statement shows the sects of the Christian population:—

Christian Sects.

		1891.			1881.	
Sect.	Total.	Males.	Females.	Total.	Males.	Female
Baptist	• •	1				
Church of England	101	* 59	42	71	44	27
Episcopalian	4	2 2	2			
Free Church of Scot-	2	2			•••	
land.						
Lutheran	4,264	2,113	2,151	34	20	14
Presbyterian	51	26	25	14	. 9	5
Protestant	60	30	30	3,320	1,644	1,676
Roman Catholic	66,678	32,937	33,741	54,660	27,277	27,382
Syrian	48	26	22	1	1	
Unsectarian	9	5	4	•••	•••	•••
Wesleyan	7	2	5	2	1	i
Not stated	34	22	12	113	61	52
Total *	71,259	35,225	36,034	58,215	29,057	29,158

In 1881 as many as 3,320 persons were shown under the vague head of 'Protestant,' but in 1891 only 60 persons returned it as their sect. The figures for the two years cannot, therefore, be compared in detail, but taking all the Protestant sects together and distributing the 'Not stated' ratably between Protestants and Roman Catholics, we get the following results:—

Sect.		1891.	1881.	Increase.	Percentage of increase.
		66,710 4,549	54,766 3,449	+ 11,944 + 1,100	+ 21·81 + 31·89 ·
, T	OTAL	71,259	58,215	+ 13,044	+ 22:41

It will be seen that the Protestants have increased faster than the Roman Catholics, but their absolute number is still very small.

The Roman Catholics constitute 93.62 per cent. of the total number of Christians, the proportion for the presidency being only 66.12 per cent.

The distribution of Christians by race is shown in the following table :-

	Race.		Total.	Roman Catholics.	Protestants.
Foreign Eurasian Native			153 204 70,902	39 181 66,490	114 · 23 4,412
		Total '	71,259	66,710	4,549

RELIGION. Race of Christians.

CHAP. II.

No less than 99 per cent. are natives. It will also be seen that a large proportion of foreigners belong to one or other of the Protestant sects, while the majority of Eurasians and Native Christians are Roman Catholics.

Of the two towns in the district; Mangalore alone is of any size. Religion of

Religion. Population. Percentage. 23,398 Hindus ' 57.18 Musalmans ... 7,584 18.53 Christians ... 9,845 24.06 ... Jains 36 0.09... Pársis 15 0.03 Buddhists ... 3 0.01 40 Brahmos 0.10 ... Not stated ... 1 0.00 TOTAL 40,922 100.00

The distribution urban popuof its population according to religion is shown in the marginal statement. The proportion of Hindus is considerably lower that Musalmans and Christians higher

than the proportions for the district as a whole. These figures show clearly that Musalmans and Christians are more partial to town-life than Hindus, a feature which is observed throughout the presidency.

The subjoined statement shows the names of the various castes returned at the census of 1891 and the number of persons who returned each. The classification of the castes is based on their traditional occupation or origin, but it must not be regarded as final, nor can it be assumed that every name which appears in the list is that of a real, separate and distinct caste. There are 49 names which are left unclassified owing to absence of information about them. Some of these are probably the names of foreign castes distorted by the enumerators in their attempt to transliterate them into their own vernacular.

The largest easte is the Billava, which has a strength of 125,663. The Bráhmans come next with 95,739, the most important sections of them being the Sárasvats, Shivallis, Havigs and Kótas. Then come the Máppillas (90,000), Bants (70,000),

CASTE.

CHAP. II. Caste. Nádavas, who are closely allied to the Bants (39,000), Gaudas (43,000), Mogérs (31,000), Kumbáras or potters (27,000), Maráthis (26,000), Tiyyans (24,000), Kammálas (22,000), Halepaiks (22,000), Dévadigas (19,000), Náyars (15,000), Kudubis (11,000), Gánigas (11,000), and Kólayáns (10,000). That interesting tribe, the Koragas, numbers only 4,355. Of the Native Christians, 70,641 have returned their caste as such, while of the remaining 261, as many as 240 are Bráhmans.

At the census every individual was required to return his or her mother-tongue and this information was obtained for the whole population with the exception of 318 individuals. In many cases, however, the name of the caste was entered in the language column and great difficulty was experienced in ascertaining whether these castes had special dialects of their own. In all but a few cases it was found that they had not, and the numerous entries met with in the schedules were eventually reduced to the 32 items given in the following table. Of these, the first, $Ar\acute{e}$, was taken as a separate dialect on the strength of a report from the Collector, but it was subsequently discovered that it did not differ appreciably from colloquial Maráthi, and there can be no doubt that it is merely a synonym for that language. On the other hand, it is possible that some of the lower castes, such as Nalke, Pombada, &c., do speak a patois of their own, but it is in such cases very difficult to decide whether the differences from ordinary Tulu or Canarese are so great as to warrant separate classification.

Language.

Notwithstanding the name of the district, Canarese is not the predominant language, for Tulu is the mother-tongue of 43.59 per cent. of the inhabitants and Canarese of only 20.23 per cent. Malayálam is spoken by 18.16 per cent. and Konkani by 12.33 per cent. Hindustani was returned as their mother-tongue by 1.57 per cent. of the population and Maráthi by 3.31 per cent. Tulu shows no decided signs of being driven out by Canarese or Malayálam, for the numbers claiming it as their mother-tongue have increased since 1881 by 8.20 per cent., which is not much less than the rate of increase of the population of the Tulu tracts. Canarese, indeed, has increased by only 4.98 per cent., but the numbers speaking Malayálam have advanced by 18.46 per cent. The distribution by taluks of these languages is shown in the subjoined statement;—

CHAP. II.

	Number returning

Total	460,209	213,551	191,696	130,191	34,925					

in the Amindivi Islands, and it is spoken by about 10 per cent. of the inhabitants of Mangalore taluk. Tulu is found chiefly in Mangalore, Udipi and Uppinangadi, and it is also the mothertongue of about 30 per cent. of the population of Kásaragód. proportion of the Canarese-speaking population varies from 4 per cent. in Mangalore to 79 per cent. in Coondapoor. Konkani is found chiefly in Mangalore and Udipi, but in neither of them is it the predominant language. Maráthi is spoken by about 12,000 people in each of the two taluks of Kásaragód and Udipi. Hindustani is spoken, for the most part, by Musalmans of foreign origin, who are now settled in Southern India. Koraga is the language spoken by an uncivilized tribe of the same name who live chiefly The caste returns show 4,355 of them, but by basket-making. only 1,868 have returned Koraga as their parent-tongue. It is a dialect of Tulu. Bellera is the language of a tribe of the same name, who are found chiefly in Coondapoor taluk. A few of them The total number of Belleras in the are also met with in Udipi. district is 674; and 668 of them have returned the tribal language. Vocabularies of these two languages are given in an appendix to this chapter. They require further verification, however, before being accepted as correct. Balochi was returned as their parenttongue by 33 individuals in the Mangalore municipality, all of whom were Musalman sailors. Coorgi or Kodagu is spoken by 940 persons and about 800 of these live in the Coondapoor taluk.

There are only 357 Europeans and Eurasians in the district, but 386 persons have returned European languages as their mother-tongue. The difference indicates that some natives have returned European languages as their home-speech, or that a few Europeans and Eurasians have made no return of race. Both these errors were found throughout the presidency.

As explained in the census report, the returns of age are far from accurate. We find in the case of males a violent drop in the relative numbers at age 1, then an almost equally sudden rise at age 2, continued to age 3, and then a fall at age 4. Further,

CHAP. III.

the number of children of 3 years of age is greater than the number of infants. These anomalies would not exist were the returns correct, for a population that is increasing the numbers at each age should gradually diminish as age advances. This feature is clearly brought out in the figures for South Canara in the case of persons of 5 years of age and upwards, and in this respect the age returns of this district are superior to those of most other districts.

Useful and dependent ages.

It may be assumed that all males between the ages of 15 and 59 and all females between 15 and 44 are capable of earning their own livelihood. On this assumption, 53.88 per cent. of the males and 46.10 per cent. of the females in South Canara are at the useful ages. The corresponding figures for the presidency, exclusive of the Agency Tracts, are 55.26 per cent. for males and 46.64 per cent. for females.

SEX.

The population of South Canara is made up of 510,937 males and 545,144 females. The population thus shows a preponderance of females, the proportion being 1,067 females to 1,000 of the opposite sex. In 1881, the ratio was 1,032 to 1,000, and in 1871 it was 1,007 to 1,000. The relatively higher proportion of females in 1891 can be confidently ascribed to better and more complete enumeration of females on this than on the previous occasions. The following statement gives the proportion at different ages for South Canara and for the presidency exclusive of the Agency Tracts:—

Proportion of Sexes at Different Ages.

All ages			3000		1,067	1,025

The preponderance of the female sex is most marked in the case of persons between the ages of 15 and 34 and must be due in part to the absence from the district of a considerable number of males at the working ages, and this conclusion is fully borne out by the birth-place statistics. But it is also partially due to an over-statement of age in the case of girls under fifteen.

The marginal table shows the number of male births to 1,000

	Number o male birth

Mean	1,046

female births in the district during the years 1882—1889. It will be seen from this that, on an average, about $4\frac{1}{2}$ per cent. more boys than girls are born every year, yet the census statistics show a higher proportion of females below one year. This indicates that the infant mortality is much higher among males than among females, in spite of the fact that male children are probably better cared for than female children. It is possible that the registra-

tion of births is more defective in the case of female than of male children, but the error due to this cause cannot be great, as this excess of male births is found in other districts and countries.

The statistics of civil or conjugal condition of the population of MARRIAGE. each taluk are given in the statements appended to this chapter, and the subjoined table affords information for the district as a whole as to the proportions of unmarried, married and widowed in a total of 10,000 of each sex and of the numbers at each age out of 10,000 in each civil condition:-

CHAP. III. Marriage. CHAP, III. MARRIAGE.

It will be seen from these figures that about 10 per cent. of the girls under fifteen are married; the proportion in the southern districts of the presidency is considerably below this, and in the adjoining district of Malabar it is as low as 3.85 per cent. It is thus clear that the early marriage of girls is much more common in South Canara than in any of the southern districts of the presidency. The males, on the other hand, appear to marry later than in most districts. As regards widowhood, South Canara occupies a pretty high position. Of women between 25 and 39 about onesixth are widows; for those between 40 and 50 the proportion is nine-twentieths, while for women over 50 it is a little under fourfifths. Of the men over 50, on the other hand, only 16:28 per cent. are widowers. The difference between the two sexes in respect of marriage is well brought out by the statements given above. Females marry much earlier than males, and a far higher proportion of them are widowed. There is about one widow to every two wives, while there are as many as 14 husbands to each widower. The prevalence of widowhood is not confined to the Hindus, for even among Musalmans and Christians there are 26 widows out of every 100 married females.

There are 1,151 wives to 1,000 husbands, this excess of wives being due partly to polygamy, partly to women who were either single or widowed having returned themselves as married, but mainly to the absence of husbands from the district. Among Hindus there are 1,168 wives to 1,000 husbands, while among Musalmans and Christians the proportions are 1,088 and 1,053 respectively.

There are 175,000 married women between the ages of 15 and 39, which is the normal child-bearing period. In England and Wales there are 290 births to every thousand wives of child-bearing age, and the proportion in India is probably higher, since there is a much greater desire for offspring. A proportion of 300 per thousand would give 52,500 births per annum, or a birth-rate of about 50 per mille.

CHAPTER IV.

RAINFALL, SEASONS AND PRICES.

CHAP. IV.

THE annexed statements, which were compiled in the office of the Board of Revenue, show the rainfall registered at each station during a series of years. The mean annual fall for the whole district during the twenty years 1870-89 was 141.87 inches, which is higher than that of any other district; the average number of wet days was 120. The minimum fall was 98.99 inches which was the amount recorded in 1881. The next lowest fall was 114.57 inches in 1875. The maximum quantity registered in a year was 178.61 inches (in 1878). There is very little rain during the first four months of the year, but in May the average fall amounts to 6.63 inches. From June to September the average fall is 121.10 inches and about two thirds of this is received in June and July. With October the north-east monsoon sets in, but this gives on an average only 12.46 inches, of which three-fourths is received in October. The following table shows, for each recording station, the average rainfall at the different seasons of the year:-

Statement of Average Rainfall at the different Seasons of the year.

Recording stations.	January to April.	May.	June to September	October to December.	Total.
	• 1				
Coondapoor	0.88	6.08	122.48	9.84	139.28

The foregoing statistics of rainfall are in themselves sufficient Seasons. to give a good idea of the nature of each year from an agricultural point of view. The following table, however, which has been compiled from the reports of Collectors, shows, at a glance, the character of each season, as reported by the Collector.

Fasli.	Nature of the season.
1221	Season propitious and prices favourable to the ryots.
1222	Rainfall average, but unseasonable, and crops by no means plentiful. Prices were unusually favourable to the ryots except those of garden produce, for which the demand was small.
1223	Monsoon favourable. The first and second rice crops tolerably abundant.
1224	Report not available.
1225	Report not available.
1226	Rains excessive and unseasonable. The seed was washed away from the ground and the irrigation channels destroyed; and later on the growing crops withered for want of water. Prices rose in the beginning of the year, but fell as the demand slackened.
1227	Report not available.
1228	Rain's excessive. Rivers overflowed their banks and destroyed the fields. Pepper and betel-nut suffered materially in the latter stages of the cultivation. There was a rise in prices. Cholera severe and cattle-disease destructive.
1229	Rains heavy. Heavy weather in April and a storm in May destroyed large number of cattle. Public health bad owing to ravages of epi demics. Prices low.
1230	This fasli was free from storms and contagious disorders and conse quently trade revived.
1231	There was drought at the commencement, fair weather in the middle and heavy rains at the close of the monsoon. The garden product was seriously damaged. Prices low and unprofitable to the ryots.
1232	The rains were heavy and many tanks burst at the latter end of the monsoon. The crops suffered to some extent. The price of grain was so low that the smaller farmers were utterly ruined.
1233	Report not available.
1234	Monsoon abundant, but not seasonable. Want of rain in August and September injured or completely destroyed the standing crops in the uplands. Prices were, however, low. A severe epidemic fever caused great mortality among the people.
1235	Monsoon unseasonable and unfavourable, being scanty at first, heavy in July, wild and unserviceable towards the close. Prices rose high There was great mortality from sickness and loss of cattle from murrain
1236	Report not available.
1237	Report not available.
1238	Rainfall on the whole favourable. The prices of grain fell, but thos, of garden crops advanced. Public and cattle free from disease.
1239	기가 있는 경기 때문 그는 그는 그는 그는 그는 그는 그들은 그들은 그들은 그는 그를 가는 것이 되었다. 그는 그들은 그들은 그를 가는 것이 없는 것이 없는 것이 없는 것이다.
1240	Rainfall somewhat unseasonable and the paddy crop injured by locusts in parts. Prices very low. Public health and condition of cattle good.

Fasli.	Nature of the season.
1241	Rains sufficient and seasonable; outturn generally good. The prices of rice were favourable to the ryots, but those of garden produce were very low. Cholera broke out in parts, but did not prove very fatal. The condition of cattle was generally good.
1242	Monsoon not favourable to the later crops and garden produce. Prices favourable to the ryots. Want of fodder in April and May and incessant rains in June and July destroyed the cattle in great numbers.
1243	Report not forthcoming.
1244	Season on the whole favourable for agricultural operations and whole- some both for men and cattle. Prices low.
1245	The season was generally favourable to rice cultivation, but hot land winds proved injurious to garden crops. There was a rise in the prices of garden produce. Public health good and cattle free from disease.
1246	The season was generally favourable. The first crop was excellent, but the outturn of the second crop was below average owing to the scanty rains towards the close of the monsoon. There was a rise in the price of rice. The season was healthy both for men and cattle.
1247	Monsoon abundant, though unsteady in the earlier months, and the outturn of all crops excellent. Prices generally very low. Small-pox raged with considerable virulence and the cattle suffered from an infectious disease which carried them off in large numbers.
1248	Monsoon deficient and unseasonable; and the rice crop failed or fell short of the average, except near the gháts. But garden plantation generally did well. Prices high. Public health better than in the previous fasli; but cattle were carried off in large numbers by an epidemic.
1249	Heavy early rains injured the rice crops in the low lands, and the second crop suffered partially from the scantiness of the later rains. The season was healthy both to people and cattle. Prices were higher than in the previous fasli.
1250	Report not available.
1251	Rains abundant, and, on the whole, seasonable. Outturn of crops generally good. Prices below average. Season, on the whole, healthy both for men and cattle.
1252 1253 1254 1255 1256 1257 1258 1259	Reports not available.
1260	Monsoon sufficient, though less copious than in the previous fasli. Prices favourable to the ryots. There was great mortality from cholera and considerable loss of cattle from epidemics.
1261	Rainfall generally sufficient and the season was one of abundance. There was a fall in prices except those of some garden produce. Small-pox was severe, but cholera disappeared. Murrain amongst cattle was also severe in parts.

Fasli.	Nature of the season.
1262	Rainfail abundant and crops generally good. Cholera was more prevalent than in the previous fasli, but small-pox was less so. There was not much disease among cattle.
1263	Monsoon very irregular. Heavy early rains injured a portion of the crops on the low lands, while the scantiness of rain in the latter part of the season injured the second crop. Prices were high. Cholera was more severe and fatal than in the previous fasli; but small-pox disappeared. The loss of cattle from foot-and-mouth disease was also great.
1264	Rains abundant. There was a slight rise in prices. Public health was slightly worse than in the previous fasli and the mortality among cattle was nearly 50 per cent. more owing to the early close of the monsoon and the consequent deficiency of pasture.
1265	The fall of rain was seasonable, though scanty, and the harvest more abundant than in the previous year. But there was an unusual demand on Canara rice owing to the failure of crops in Malabar, and the scarcity directed the usual supplies received from above the gháts to the eastward. There was in consequence a further rise in prices, which stood higher than at any time during the past thirty years. Fever and other diseases prevailed largely in the interior, but the mortality from cholera was only 411 against 3,068 in the previous fash. Mortality among cattle was also considerably less.
1266	Rainfall unusually heavy, but not well distributed; considerable injury was caused in some of the garden tracts by a hurricane. The heavy early rains seriously interrupted and diminished the outturn of the first rice crop and the yield of the more delicate garden products; while the failure of the later rain had an injurious effect on the second and third rice crops. Coccanut gardens gave an average yield. There was a further rise in prices owing to the continuance of scarcity and high prices in the inland districts and Malabar. Cholera and small-pox were much less prevalent than in the previous fasli, but fever of a most virulent type was very general; mortality among cattle was higher than in the previous fasli.
1267	The fall of rain was somewhat less than in the previous year, but more seasonable and the harvest consequently more abundant. Prices again advanced sturing the year by 21 to 26 per cent; the continual rise in the prices of agricultural produce did not, however, cause any suffering to the lower classes. There was comparatively little sickness, and public health was remarkably good. But murrain among cattle was widespread and destructive, the mortality among cattle being 56 per cent. more than in the previous year and nearly double that of fasii 1265.
1268	Rains heavy, but unseasonable. The yield of the first rice crop was not, therefore, abundant; but the second crop and the sugar-cane produce were, however, good. Prices rose still further during the year, and their continued rise during the past five years began to press on the poorer classes. (Iholera prevailed throughout the district, but small-pox and fever were less destructive than in the previous year. Though murrain was experienced throughout the district the loss of cattle from this disease was far below that of the previous fasli.
1269	The rainfall was about the average and the harvests better than in fasli 1268. There was a further rise in the prices of food grains. Cholera and small-pox were prevalent, but cattle were remarkably free from disease.
1270	경화 유통하다면 가장이 되는 한 사람이 되다. 그들은 아들의 아이를 하고 되었다. 그 전에 모르는 사람들이 가지 않는 것으로 걸려가 되었다. 이 점점이 없어 있다.

Fasli.	Nature of the season.
1271	Rainfall heavier than in the previous fasli except during September and October when it was very scanty. Consequently the yield of the first crop was abundant, but that of the second and the third very meagre. Small-pox was prevalent, but did not spread and soon disappeared. There was a fall in the prices.
1272	Season decidedly favourable and wet and garden crops yielded well; there was however a rise in the price of rice owing to increased demand for export. Cholera was prevalent for some time in parts and murrain, which had made its appearance in the previous year, proved destructive to cattle.
1273	Rainfall deficient and unseasonable and unfavourable to the rice crop, which yielded a small outturn. There was consequently a very large rise in prices of rice which ruled higher than in any of the previous eleven years. Garden crops throve well and the yield was good. Public health was indifferent and murrain was prevalent in a virulent form in parts and carried off considerable numbers.
1274	Season was favourable at the time of cultivation, but the rain was subsequently insufficient and later on altogether inadequate. Consequently the outturn of the rice crop was considerably below the average. There was a further rise in the prices of rice which were 220 per cent. higher than the commutation rates. The garden crops too suffered from the unfavourable season. There was further deterioration in the public health and in the condition of cattle.
1275	Early rains, on the whole, favourable to the first crop, which was, however, injured by the overflowing of the rivers and streams at some places in July. The absence of rain in September and from December to March proved very injurious, causing a partial loss of the second crop and the utter failure of the third. The cocoanut and areca plantations which had suffered in the latter part of the previous fasli yielded a rather scanty produce. Prices fell slightly. There was scarcity of good drinking water owing to long continued drought; and cholera and fever greatly increased in virulence and proved very destructive. Cattle diseases of a virulent type prevailed in the district and this coupled with a great scarcity of pasture caused a heavy mortality among cattle which amounted to between three and four times that of the previous year.
1276	Rains began late, but were, on the whole, favourable to rice cultivation. The yield of the areca and cocoanut plantations, however, which had suffered in the previous year, was scanty. Prices rose from 7 to 23 per cent. There was a slight improvement in the public health, but the mortality among cattle was considerably greater than in the previous year.
1277	Rainfall very seasonable and favourable to both rice and garden cultivation. Prices fell by about 40 per cent. Small-pox and cholera decreased, but fever was largely prevalent. The loss of cattle was only half that of the previous fash owing to improved pasturage.
1278	Early rains sufficient; but there was a failure in September and October, which considerably damaged the second and third crops. Public health and the condition of cattle good.
1279	Rainfall somewhat deficient, but the season was not favourable. The first crop suffered from want of water to a little extent as also garden plantations, but the second and third crops fared well. There was a rise in prices which ranged higher than those of the previous year and the average of the ten previous years. There was a further improvement in the condition of cattle, but public health was indifferent.

Fasli.	Nature of the season.
1280	The season was, on the whole, favourable. The yield of all the three rice crops and the garden plantations was good. Prices fell from 21 to 36 per cent. There was a severe outbreak of small-pox during the year and cholera, was also prevalent. Murrain prevailed among cattle in some places with great virulence.
1281	Rainfall copious, but unseasonable. The first rice crop suffered in consequence and the outturn was poor. The second and third crops and garden plantations, however, fared better. There was a further fall in prices, which ranged from 15 to 54 per cent. below the average of the preceding ten years. Public health was good, but the condition of catte was far from satisfactory owing to the prevalence of murrain in a virulent form.
1282	Rainfall unusually heavy. The first rice crop suffered from excess of water and was in part destroyed by rot and insects. The second crop and garden plantations did well. Prices below the average of the previous ten years. Public health and condition of cattle better than in the previous fasli.
1283	Rainfall seasonable, though not abundant. Outturn of crops satisfactory. There was a considerable fall in the prices of rice, but the prices of ragi and horsegram showed an advance. Public health was good and cattle were free from epidemic disease.
1284	Season not unfavourable, and the outturn of crops, on the whole, satisfactory. There was a rise in the price of first sort rice and paddy. There was no cholera but little small-pox; fever and dysentery were prevalent and considerably increased the total mortality. Cattle diseases were largely prevalent and there was considerable loss of cattle from disease and from wild beasts.
1285	Rainfall scanty and season unfavourable. The first rice crop yielded fairly, but the second and third crops, as also the garden plantations, suffered seriously from deficiency of rain. Prices rose slightly. There was cholera in the district and public health was not satisfactory. Cattle suffered from want of pasture and rinderpest was prevalent during the latter half of the year.
1286	Early rains abundant, but the latter part of the season exceptionally bad. The first rice crop yielded a plentiful harvest while the second and third crops as well as the garden produce suffered seriously. There was a considerable rise in prices which ruled much above the average of the ten previous years, partly due to short produce and partly to the prevalence of famine in other parts of the presidency. Cholera was prevalent during the early part of the year and was succeeded by an outbreak of small-pox of a virulent type which prevailed more or less throughout the district and caused over 7,000 deaths. Cattle suffered from want of pasture during the early part of the year, but their health was generally good.
1287	Season very favourable and the outturn of all the crops satisfactory. Prices rose still further during the year owing to the continuance of famine elsewhere and were from 46 to 223 per cent. over the average of the ten previous years. Public health was bad and cholera carried off nearly four times as many victims as it did the preceding year and was succeeded by fever of a severe and fatal type which carried off over 10,000 victims; and though small-pox was less virulent, dysentery and bowel-complaints were prevalent to an unusual extent. Cattle were free from epidemic disease.
1288	3개 [12] 사람이 얼마를 들었다면 보고 하면 되었다. 그리고 하면 하면 있는 것이 되었다면 되었다면 하는 사람들이 되었다면 하는 것이 되었다면 하는 것이 되었다면 하는데 없다.

Nature of the season. Fasli. greater extent throughout the district, and, notwithstanding a considerable decrease in the mortality from other causes, swelled the deathrate to a higher figure than that recorded in any year since the introduction of registration of deaths. The condition of cattle too was bad, foot-and-mouth disease and rinderpest having prevailed largely in various parts of the district. Rainfall, on the whole, abundant and well distributed; outturn of crops 1289 satisfactory, that of garden plantations even exceeding the yield of the previous year. There was a further fall in the prices of food-grains and a marked improvement took place in the public health. condition of cattle was unusually bad, the losses from disease, which in many cases was communicated by pack-bullocks from above the ghats, and from the ravages of wild animals being double those of the previous year. 1290 Rainfall deficient. The first rice crop suffered from want of rain and the second from insects. Public health was good and there was a decrease in the mortality among cattle. There was a fall in prices due to unusual depression in the export trade combined with a somewhat larger importation of food-grains. 1291 Season not unsatisfactory; outturn not below average. Prices fell again owing to the depressed condition of the export trade due to the competition of Bengal rice in many of the markets formerly supplied from Canara, and were 46 to 107 per cent. below the average of the ten previous years. Public health was, on the whole, good, though cholera made its appearance in November and there was small-pox in several parts. The mortality among cattle from disease was only one-half of that in the previous year. 1292 The rains were unusually heavy in June and July causing heavy freshes in all the rivers and considerable injury to the first rice crop in their vicinity. The fall of the subsequent months was, however, moderate and the outturn of the year quite up to average. There was a considerable rise in the price of all grains except first sort rice, notwithstanding diminished exports; this is attributable to the disastrous floods of the early part of the year which was followed up by a sudden demand for grain on the railway works in Goa. 1293 Rainfall sufficient and, on the whole, timely and general. Floods in June and July again injured the first rice crop in the vicinity of rivers and the second crop was damaged seriously by insects in several parts of the district, yet the crops were, on the whole, good and quite up to average. Public health not bad. Health of cattle generally satisfactory. 1294 Rainfall deficient and much below the average of previous years; but the season was, on the whole, not unfavourable and the yield of all the crops was more than fairly good. There was a slight rise in prices in consequence of an increased demand. Fever continued throughout the year and small-pox was more than usually prevalent. Cattle were generally healthy, but the loss from the ravages of wild beasts was large. 1295 Rains seasonable and sufficient and outturn average. Prices below average. A slight increase in the total mortality, notwithstanding considerably diminished mortality from small-pox and fever. Condition of cattle not satisfactory owing to the prevalence of foot-and-mouth disease and rinderpest. 1296 Rainfall below average, but seasonable, and outturn average. Prices were lower than in the previous year. There was an improvement in the public health, but the condition of cattle was bad.

Fasli.	Name of the season.
1297	Rains seasonable and sufficient and outturn average. There was a further fall in prices. Public health underwent a change for the worse, and the condition of cattle was unusually bad, the mortality among cattle from disease being four times what it was in the previous fasli.
1298	The total rainfall was about the same as in the previous year, but the later rains of the monsoon were so scanty as to interfere with the cultivation of the second crop. There was a rise in prices. Public health satisfactory. Cattle continued to suffer.
1299	Rainfall above average and timely, and the season very propitious. Prices, however, rose slightly elsewhere. Public health satisfactory and condition of cattle good.
1300	The rainfall was both scanty and badly distributed and the season was the worst experienced for many years. The rice crop failed more or less completely in the uplands and gave a poor outturn elsewhere. The second crop suffered equally; there was, however, no rise in prices, as the worst effects of the bad season were not felt till the next fasli. Public health bad; condition of cattle good.
1301	Rainfall less than that of the previous fasli, but much more timely. The second rice crop was a failure, but the outturn of the first and the third was good. A rise in the prices of all food grains. Public health and condition of cattle good.

The above record contains a gloomy view of the past, but allowance must be made for the influence upon the views of the district officers of failures restricted to comparatively small areas. Landowners and farmers seldom admit that a season is entirely satisfactory; they set up a standard of absolute perfection, and it is no wonder that judged by this standard every season leaves something to be desired. South Canara, however, is an exceptionally favoured district, and famine is almost unknown. The rains during the south-west monsoon are so plentiful that there is hardly any necessity for storing water for cultivation as in other districts of the presidency. In fact, rice, which forms the staple food-grain of the district, is raised by means of rain alone and without the aid of any artificial irrigation. Prices of food-grains have fluctuated a good deal and have sometimes been very high, but the district does not appear to have suffered from any severe scarcity. In 1812 relief works were opened, but the distress was due to the abnormal export which raised prices. There have subsequently been a series of famines in other districts, but none of them actually extended to South Canara, though they tended to raise the prices of food-grains in that district.

PRICES.

The annexed statistics of prices have been compiled in the office of the Board of Revenue. They show the course of prices since 1874-75 of rice, ragi and paddy. The average price of these for the whole district is given for each month of each year, and the mean annual price is given for each recording station.

Average Prices of Food-grains in the South Canara District, in seers of 80 tolas per rupee.

CHAPTER V.

PUBLIC HEALTH.

THE climate of South Canara, as well as of the west coast generally, is characterised by excessive humidity during the greater part of the year, as the south-west monsoon lasts from June to October. Before the onset of the monsoon the air is sultry and Climate. oppressive, and dense cloud masses accumulate and are driven inland before the strong westerly winds. There is some rain variable in amount, but usually light in April; but the burst of the monsoon, subsequent to which the rain falls in almost incessant torrents, rarely occurs before the last week of May. Throughout the following months-June, July and August-the rainfall is very heavy, but it abates during the remaining months; occasionally there are breaks or comparatively rainless intervals, at which times the heated atmosphere becomes charged with the vapour arising from the saturated soil—a condition favourable to the production of malaria. From November to February the climate is cool, the temperature in the shade ranging from 68° to 84°. At this period also strong easterly winds blow during the night and morning, the wind throughout the rest of the day being from the west or north-west. Towards March the heat begins sensibly to increase, the temperature ranging from 80° to 92°. The usual sea breeze blows during the day, but the nights are hot, still and oppressive. The climate of the west coast has a relaxing and debilitating effect on Europeans, especially women and children, who become pale and anæmic after prolonged residence. This is due, not only to the depressing nature of the climate, but also to the inability to indulge in active exercise, as the humidity of the atmosphere quickly induces fatigue and lassitude, while free perspiration follows on comparatively slight exertion. Digestive and cutaneous disorders are the commonest forms of minor ailments, gradual deterioration of health being the rule and acute illness the exception. Those whose occupations are sedentary are more prone to ill-health, and, on the other hand, persons of active habits and whose duties necessitate much travelling and out-door work generally preserve good health. The Tulu-speaking natives

CHAP. V. PUBLIC HEALTH. and health.

Note.—The greater part of the information contained in this chapter has been kindly contributed by Surgeon-Major W. A. Lee.

CHAP. V. ; PUBLIC HEALTH.

of the district and the lower caste Christians are strong and robust, but the educated classes—Bráhmans and higher caste Christians—who enter Government employ and fill the clerical posts in public offices, though often of good physique, lack vigour and strength and are rarely long-lived.

Vital statistics.

In the rural tracts of South Canara births and deaths are registered by village accountants, while in the municipal town of Mangalore this task is performed by a special agency. The registration is better done in the latter than in the former, but it is defective in both, and the statistics are only useful for comparing one year with another. The inaccuracy of the registers can be judged by the fact that, according to them, the excess of births over deaths during the period between the census of 1881 and that of 1891 was only 76,278, while the increase of population as shown by the census returns was 96,517. The census was as accurately taken in the one year as in the other, and there was hardly any immigration into the district. It is, therefore, evident that the registration of births and deaths is inaccurate, and the inaccuracy is greater in proportion in the case of births than deaths. birth-rate is probably about 50 per mille per annum and the true death-rate about 35 or 40 per mille per annum. According to the registers, however, the mean birth-rate for the years 1888-92 is under 30 in Kásaragód and Mangalore, while the highest rate is 32.88 (in Coondapoor). The death-rate is only 18.01 in Kásaragód and the highest rate is 26.86 (in Uppinangadi). for the whole district are 29.76 for births and 21.42 for deaths. Even in the Mangalore Municipality the rates are far from the truth, the mean birth and death rates for the last five years being, respectively, 29.61 and 25.03 per mille per annum. It has already been shown that if there are 300 births per annum to every 1,000 married women of child-bearing age, the birth-rate would be over 50 per mille.

Registration is best in the case of Hindus, who have for the five years 1888-92 a mean birth-rate of 30.08 and a mean death-rate of 22.02 per mille. For Musalmans the rates are 27.89 and 19.37, while for Christians they are 29.00 and 16.13 respectively. Taking the figures, however, as they stand, some useful information can be obtained from them.

Birth-rate.

The birth-rate shows a small decline in 1884 and a violent drop in 1888; since that year the birth-rate has been gradually declining until 1891, when if was only 29·18 per mille. The low birth-rate in these years is possibly due to the fact that prices of food-grains were high. The statement giving the births in each month shows that births are most numerous from March to

July, while their number is smallest during September, October and November. There are on an average 104 boys born to every 100 girls.

CHAP. V.
PUBLIC
HEALTH.

Death-rate.

In the eleven years 1882-92 the death-rate varies from 16.36 per mille in the first year of the series to 24.79 per mille in 1885. The rate of mortality is lowest in March, April and May and highest in July, August and January.

Nearly 22 per cent. of the total number of deaths occur among infants under one year of age, but high as this proportion is, there can be no doubt that many of the deaths of infants escape registration, for the registered deaths give an infant mortality of only 153 per mille for males and 129 per mille for females, while the actual rate is about twice this.

The marginal statement shows the principal causes of death. Canses of

The returns on which it is based are unfortunately defective, for

diseases of the respiratory organs, rheumatism and skin diseases, especially ringworm and itch. Venereal diseases are rife, especially in the more populous towns and villages; the town of Udipi enjoys an unenviable pre-eminence in this respect, but the same fact is noticeable wherever there are temples attracting numbers of people to their annual játras. Intestinal worms (the Ascaris lumbricoides or round worm being the commonest form) infest individuals of all ages. The deaths from suicide are at the rate of 74 per million living; in England and Wales the rate is about 80 per million. In that country the tendency to suicide is much greater among males than among females, and the same feature is observed in South Canara, although in most districts of the presidency the reverse is the case. In South Canara the average rate of death from suicide for the last eleven years was 84 per million for males and 57 per million for females.

PUBLIC HEALTH. Causes of

CHAP. V.

death.

Malarious fevers, besides constituting the commonest and most widespread of all forms of disease met with, also contribute most largely to mortality and suffering. They occur at all periods, but are exceptionally prevalent at certain seasons and in certain localities. The forest-clothed country stretching away from the foot of the ghats is naturally the most unhealthy and there the worst and most virulent fevers prevail. The population in the most unhealthy parts is either stationary or diminishing and many, both adults and children, are permanently enfeebled by the sequelæ of such fevers, e.g., anæmia, dropsy, enlarged spleen. Several fertile localities have been abandoned both from their unhearthiness and from the decrease of population by deaths and the departure of survivors. The diversion of a large labour supply to the neighbouring coffee-planting taluks of Mysore and Coorg may, however, account to some extent for the reduced area under cultivation observed in particular places. The portion of the district bordering on the coast is comparatively healthy, the low lands being highly cultivated, while the intervening uplands are dry, arid, and free from jungle, conditions adverse to the development of malaria.

Some of the low-lying hill-enclosed village sites in this area are, however, hardly less unhealthy than more inland parts, as, from their situation, their drainage is defective and the level of the ground water in them is necessarily high.

The unhealthy season commences prior to the onset and during the early portion of the south-west monsoon. With the rains which fall in April and which are sometimes heavy near the gháts, the number of fever cases and the resultant mortality gradually increase. The wells from which drinking water is obtained, and which are generally only shallow excavations unprotected from, and therefore exposed to, surface pollution are now low, and the water they contain bad. Water from streams, or from pits sunk in their dry channels, is also used for drinking and is believed to be productive of fever; while the monsoon lasts the mortality from fevers continues high, but probably many of the deaths so reported are due to intercurrent lung affections. or to other diseases non-malarial in their causation, but attended with fever.

The six months, from October to March, are generally healthier than the other half of the year, but in January the fever mortality is usually higher than in either the preceding or subsequent month. In the town of Mangalore many cases of enteric fever, with a high death-rate, occur during this season, the incidence of the disease being chiefly limited to a low badly-drained part of

the town with a contaminated water-supply. Bowel-complaints come next in order of frequency and fatality to fevers, the mortality from them being about one-third that from the latter. The vicissitudes of climate, the wet and cold during the rains, and Causes of the want of proper diet and suitable clothing, render children and aged people peculiarly susceptible to these complaints.

CHAP. V. PUBLIC HEALTH.

death.

South Canara suffers less than any other district in the Madras Presidency from cholera in an epidemic form; indeed few parts of India enjoy such immunity from the ravages of this plague. Local conditions and modes of living are adverse to the spread of cholera, as almost all villages consist of comparatively few houses relatively to the area over which they are dispersed, and hence are without a common source of water-supply from the specific contamination of which the disease could be propagated.

When, therefore, cholera makes its appearance in a village, it is not infrequently limited to the inmates of the infected house, or to those dwelling in the immediate vicinity, or to persons who have visited affected individuals, while those residing at some distance, protected by their isolation, as well as by the possession of a separate water-supply, escape.

Records throwing light on the medical history of the district in the past are unfortunately not available, perhaps even are not extant, as it is only within comparatively recent years that any approach to accuracy in the collection and tabulation of vital statistics has been attempted or attained.

In the period 1882-92, although but four years were free from cholera, the total number of deaths from this cause was only 3,676 equal to an average mortality of 0.32 per mille per annum.

The origin of outbreaks has been frequently traced to pilgrims returning in parties from Tirupati and who had either become infected with the germs of the disease at that notoriously insanitary Hindu shrine, or in the course of their homeward journey through This was the mode of introduction in cholera-stricken localities. the 1885 outbreak. In that year the disease appeared amongst and was limited to a party of pilgrims returning from Tirupati, 14 deaths occurring out of 22 attacked.

The epidemic which commenced towards the close of 1887 and terminated only in 1889 was of a far more serious character. All the particulars collected regarding it are contained in the following extract from the Medical Officer's Report for 1888:-

"Cases of cholera occurred throughout the greater part of "the year, except in the months of March, April and May. In "January and February this disease was confined to nine villages CHAP. V.
PUBLIC
HEALTH.

· Causes of death.

"in the Udipi taluk, the attacks and deaths in which were 43 and "15 respectively. The outbreak, which had existed since Novem-"ber 1887, then subsided. Cholera again made its appearance in "the district in June in the southern part of Kasaragod taluk on "the boundaries of Canara and Malabar, in which latter district "the epidemic was then prevalent and steadily extending its devas-"tating course northward until it reached Canara. In the three "monsoon months—June, July and August—the number of cases "and deaths was small, being but 17 and 12 respectively, and the "outbreak was limited to four villages only—Padane, Chandare, "Pillikód and Níléshwar kasba, with which and Malabar there is "free communication by boats plying on the backwaters and river. "In the succeeding month, September, cholera prevailed with in-"creasing severity not only in Kásaragód, but also in Udipi, Man-"galore and Uppinangadi taluks. In Kásaragód the outbreak. "as before mentioned, was traceable to its contiguity to Malabar. "In Udipi taluk the history of its origin in four villages, where "it was personally investigated, pointed to its introduction from "Mysore, those first attacked having recently arrived from that "province where cholera was then widespread. This is a not un-"common method for the disease to be propagated in South Canara." "as a large number of coolies annually migrate to Mysore and "Coorg to work on coffee estates, who, so great is their dread of "cholera, immediately abandon their employ on the appearance of "the disease in their midst and hasten back to their native villages "in the plains, carrying infection with them, and in this manner "disseminating the disease far and wide. This view is further "borne out by the fact that while in Kásaragód cholera spread along "the sea border, in Udipi and the other taluks it first appeared "in inland villages on or near the trunk roads leading from the "gháts to the low country.

"Medical subordinates were deputed to the disease-infested villages to treat the sick and carry out sanitary measures, and besides, chlorodyne and 'cholera pills' were freely distributed to all police stations for administration by constables specially detailed for the purpose. Much good was effected by these agencies, though instances were not infrequent where the sufferer's friends were reluctant to allow medicines to be administered, as they attributed the attacks to the maleficent influence of some irate demon who would have to be propitiated and appeased by other means. In November cholera made its appearance in the town of Mangalore, causing in that month 14, and in the following month 56, deaths. The history of the first attacks could not be traced, but there can be little doubt as to their source, having regard to the fact that there was free intercourse both by

"sea and land with affected localities. Most of the attacks occurred "amongst fishermen and Mappillas,—ill-fed classes subsisting "chiefly on fish and not addicted to cleanliness either in their persons and habits or in their dwellings.

CHAP. V.

PUBLIC
HEALTH.

Causes of death.

"The only other class which suffered to any extent was that of "the toddy-drawers, whose circumstances are much the same as "those of the previously mentioned classes. There were no cases "among the more exclusive sections of the community, e.g., Bráh-"mans, which may be ascribed to the fact that they live apart from, "and do not mingle with, other classes and so are not exposed to "contagion; and also because each such household usually has a "separate source of water-supply, whereas the wells in the more "populous parts of the town inhabited by fishermen are fewer in "number, and, being used in common, are hence more liable to "be contaminated. All cases of cholera occurring in the town "were immediately reported at the municipal hospital, and were " promptly visited by a medical subordinate deputed to that special "duty with instructions to treat the sick and superintend the disin-"fection of houses where there had been cases. In not a few in-"stances it was thus ascertained that the disease, though reported "as such, was not true cholera, but only dysentery or diarrheea, "and this circumstance points to the conclusion that many of the "cholera cases reported by the police—the official reporters—may "have similarly been not real cholera, but some form of bowel-"complaint, which, in non-epidemic years, would have been "classed as such by village shánabhógas."

Influenza was prevalent throughout the district in the spring of 1890, but subsided at the onset of the monsoon in May. The first cases occurred among the maritime population, wherefore it is reasonable to assume that the disease was introduced by persons arriving by sea from places where it was already rife, such as Bombay. No increase of mortality was directly traceable to this malady, but it, no doubt, rendered those who suffered from it in its severer forms more prone to contract and succumb to other ailments.

Small-pox caused 5,845 deaths in the eleven years 1882-92, an average of 0.50 per mille per annum. Relatively to population this is a comparatively low mortality and compares favourably with that reported elsewhere in the presidency. The appearance of this disease in any locality can generally be traced to the arrival of an affected individual from Mysore or Coorg. Its failure to spread extensively is due to the circumstance that most of the district officials have taken interest in the promotion of vaccination which is consequently carried on very successfully.

PUBLIC HEALTH. Causes of

CHAP. V.

Causes of death.

The infective diseases of infancy and childhood—measles, chicken-pox and whooping cough—make their appearance frequently in Mangalore and the larger villages. Enteric fever is of not infrequent occurrence in Mangalore. It is usually of a very severe type, many cases terminating fatally, and is rarely met with, except in the hot season when the water-supply becomes defective and its quality bad. Very little is known as to the origin and causation of this disease, and further investigation is therefore very desirable.

Two diseases may be particularly referred to under the category of rare diseases—leprosy and elephantiasis. The latter disease is infrequently met with and is chiefly confined to dwellers on the coast. The subjects of this malady are usually poor and ill-fed, but a few cases have been observed among members of Roman Catholic families of the better class who form a small community closely allied by inter-marriages. Lepers also are generally met with near the coast,—seldomer in the interior. The number of lepers in the district is 916 according to the recent census, which is 7 more than the number enumerated on the previous occasion.

Since 1381 two leper asylums have been established in Mangalore by local Christian Missionaries, and numbers of lepers have flocked to the shelter thus afforded, not from South Canara alone, but from other districts, and even from Bombay as well. In one of these institutions maintained by the Jesuit Society upwards of 50 indigent lepers are inmates, and amongst these can be witnessed subjects in every stage of the disease, from children, the progeny of leprous parents, who exhibit the beginnings of the hereditary (or acquired?) complaint in anesthetic light-coloured patches on the surface of their bodies, to sufferers from its most destructive effects, such as deep foul ulcerations and mutilations of the features and extremities.

Most of the lepers gave a history of leprosy having existed in their families, a circumstance which, taken for what it is worth, confirms the views entertained regarding the contagious nature of this disease; a similar belief is also held by the native races.

Among rare diseases the almost entire absence of stone in the bladder, so common in some parts of India, is noteworthy.

CHAP. V.
Hospitals
AND DISPENSARIES.

There are 19 l hospitals and dispensaries in South Canara, which gives one to every 205 square miles and every 55,583 of the population, the average for the presidency being one to every 319 square miles and every 80,430 inhabitants. Of these institutions seven are hospitals for the treatment of both in- and outpatients, while the remainder are dispensaries in which out-patients only are treated. The charge of the hospitals is held by Civil Apothecaries and that of the dispensaries by Hospital Assistants. In 1887 the District Board made arrangements for the training of natives of the district as Hospital Assistants to take the place of the Government Hospital Assistants hitherto in charge of the dispensaries, as it was believed that the former would be more acceptable to the people, and the scheme has so far worked very satisfactorily.

The issue of G.O., dated 22nd February 1883, No. 391, Public, directing that, in future, Civil Surgeons, who till then were confined to their head-quarter stations, should be constituted Medical and Sanitary officers of their districts, and the devolution to Taluk Boards of sundry powers hitherto exercised by a District Board swayed by official nominees, were signalized by an era of advance in the establishment of medical institutions in the district. Local bodies were naturally desirous to expend their funds on locally beneficial objects, such as the opening of dispensaries, in which aim they were guided by the advice and experience of the District Surgeon, who was able to make himself acquainted with the needs of every locality by personal investigation and inquiries.

The subjoined table shows the location and class of the several institutions and the dates on which they were opened:—

	Jalsúr	Do. do	. 24th Nov. 1887.

¹ Since the above was written a hospital for women and children, entitled 'Lady Wenlock's Hospital,' has been opened and a qualified lady apothecary placed in charge.

As the Mangalore hospital was the earliest to be established in the district, a brief account of its history may be of interest. It was opened by Government in 1848 in pursuance of orders passed by the Honourable Court of Directors on a memorial submitted by the inhabitants, praying for its establishment in Mangalore to supply a much-felt want. At the commencement a building was hired for the purpose of an hospital at a rent of Rs. 14 per mensem and the following establishment was entertained:—

CHAP. V.
Hospitals
AND DISPENSARIES.

	얼굴에 크셨다니요 동안됐다고 말하는 얼마를 하면 나가는 모르다.	RS.	A. P.

1	cook	7	0 0
1	ward cooly	4	8 0
1	tóti	3	8 0
1	waterman	5	0 0

The allowance to the medical officer was Rs. 50.

Owing to the increased popularity of the hospital, it became necessary to supplement this establishment, and accordingly a nurse, a sweeper, and a washerman were entertained. A separate building was also constructed for the purpose of the hospital in 1851. In 1852 the Government appointed a Native Surgeon, on a salary of Rs. 100, to aid the Zilla Surgeon in his duties. 1863 the fownspeople, who appear to have taken great interest in the maintenance and improvement of the institution, resolved, at a meeting convened for the purpose, to relieve Government of a portion of the cost of its up-keep by raising annual subscriptions towards its support. This step met with the approval of Government, who ordered that effect should be given to it and accordingly withdrew the allowance hitherto given for the food, clothing, and attendance on the sick poor treated in the hospital. In 1871 the hospital was transferred to the care of the municipality, under Madras Act III of 1871, and since that date it has been exclusively maintained from municipal funds. The District Board contributes a sum of Rs. 600 per annum, in consideration of the number of patients treated who come from various parts of the district.

The following medical officers have been consecutively in charge of the hospital from its opening to the present date:--

HOSPITALS
AND DISPENSARIES.

An Assistant Surgeon was appointed in 1883 to assist the District Surgeon in the working of the hospital and to take the place of the latter when absent in the district on tours of inspection.

The attendance of patients from the commencement to the present date has been as follows:—

	Admi	ssions.	યા હોં જ	Admi	ssions.		Adm	issions.

The Local Fund hospitals and dispensaries were opened on the dates shown in the table opposite each, and have since filled an ever-extending sphere of usefulness and beneficence. Eight of these institutions have trained midwives, natives of the district, attached to them, and their skilled services are much appreciated by the people amongst whom they work.

The dispensary in the Amindivi Islands is maintained at the charge of Provincial revenue. The dispensary building was erected in 1876, a sum of Rs. 200 having been sanctioned for the purpose (G.O., dated 9th July 1875, No. 1031, R.D.). A third-class Hospital Assistant, with a special allowance of Rs. 10, was appointed to do duty in the island in 1874. The Hospital Assistant in charge was sent to Madras in 1879 to undergo a course of meteorological instruction in the observatory, Madras, under Mr. N. R. Pogson, the then Meteorological Superintendent, and since that time, the Medical Subordinate in charge has also been Meteorological Assistant, with an allowance of Rs. 30 per mensem for the special duty. The dispensary has been but little resorted to by the islanders, probably because the Hospital Assistants consecutively in charge failed to acquire their confidence. A Muhammadan native of Canara has recently been entertained for medical training with a view to his ultimate employment in Amindivi, and in the hope that he will be more successful in conciliating the prejudices of the natives than were his predecessors.

No records available.

The annexed table shows the total number of patients treated in the hospitals and dispensaries in the district during the past five years.

CHAP. V.
Hospitals
AND Dispensaries.

There has been a steady increase in the number of patients since 1889, which indicates that the European method of treatment of diseases is gradually gaining favour with the natives. Of the total number of patients in 1892, the number of in-patients was 796. Taking the average of the five years 1888–92, it is found that 59 88 per cent. of the patients are Hindus and 14 44 per cent. are Musalmans. As the Musalmans constitute only 10 60 per cent. of the total population of the district, it is evident that they resort to skilled medical aid to a relatively greater extent than the Hindus. Musalmans, however, are more prone to town life than Hindus, and they are thus more within reach of the influence of hospitals.

The average number of patients treated during the five years was 59,721, and the subjoined abstract shows the most common diseases among these:—

Diseases of the eye	1,553
Diseases of the nervous system	1,217
Diseases of the ear	1,213
Unspecified diseases of the respiratory system	2,107
Dyspepsia	1,236
Other diseases of the digestive system	5,011
Diseases of the skin	6,256
Ulcers	2,172
Malarial fevers	11,597
	10,429
Rheumatic affections	2,789

During the same period 122 major and 1,323 minor operations were performed annually. The average expenditure on hospitals and dispensaries during these five years was Rs. 22,824 contributed as shown below. The average cost of each patient treated was 6 annas and 1 pie.

Statement of the Average Annual Expenditure during 1888-1892.

CHAP. V.
HOSPITALS
AND DISPENSARIES.

CHAP. V.

At the census information was collected as to the number of INFIRMITIES! persons afflicted with insanity, congenital deaf-mutism, blindness and leprosy. The returns are most probably incomplete, but they are useful for comparison of one enumeration with another and of one locality with another. An abstract of them is given in the following statement:-

Statement showing the Number of Infirm Persons in a Million of the Population.

	Insa	mes.	Deaf-1	nutes.	Bli	nd.	Lep	ers.
	1891.	1881.	1891.	1881.	1891.	1881.	1891.	1881.
South Canara Presidency	2·17 2·16	3·22 3·26	5·32 7·57	2·65 5·33	12·16 10·22	14·47 16·00	8·67 3·54	9·47 4·68

There is relatively less deaf-mutism in South Canara than in the presidency as a whole, while the proportion of persons afflicted with the other three infirmities is higher. The proportion of lepers is the highest in the presidency, and this is in accordance with a generally observed fact that this disease is more common in moist than in dry localities. Only two districts—Anantapur and Malabar—contain a relatively larger number of blind persons. Of deaf-mutes South Canara has a smaller proportion than any other district except Malabar, and it occupied the same position in 1881 Insanity and deaf-mutism are less common on the coast than inland, while blindness and leprosy are more frequently met with in the taluks that border on the sea than in the interior of the district. As regards leprosy the statistics may be influenced by the existence of a leper hospital at Mangalore.

		Numl	per of infirm per	rsons per n	illion.
		Insanes.	Deaf-mutes.	Blind.	Lepers.
Coast taluks Inland taluks		209 278	513 682	1,253 926	896 640
	TOTAL	217	532	1,216	867

Lepers are most common in Mangalore and Udipi. The latter also contains the highest proportion of blind persons.

The marginal statement contains comparative statistics of the number of infirm persons in 1881 and 1891. It will be seen that there has been a decrease of insanity and blindness and an increase

of deaf-mutism and leprosy. The increase under deaf-mutism is

. Comparative Statement of Infirm Persons in 1881 and 1891.

Infirmity.	1891.	1881.
Insanity	229	309
Deaf-mutism	562	254
Blindness	1,284	1,388
Leprosy	916	909

probably more apparent than INFIRMITIES. real, as it is believed that the return of deaf-mutes was very It is also imperfect in 1881. possible that a number of people who were only deaf were returned in 1891 as deaf-mutes. The increase under leprosy is

triffing and the relative number of lepers is appreciably lower than it was in 1881.

The degree of prevalence of each infirmity in the various castes differs considerably, but the numbers in most cases are too small to allow of any reliable inferences as to the relative frequency of any of the four maladies among each section of the population.

A statement is annexed showing for castes whose district strength exceeds 10,000, the number of persons among whom one is afflicted with each infirmity. Statements giving the numbers suffering from each infirmity in each taluk, with age details, are also appended:

Statement showing for each Principal Caste the Number of Persons among whom one is afflicted with each Infirmity.

CHAP. V. VILLAGE HYGIENE. Of the three essential desiderata of village hygiene, viz., provision of pure drinking water, drainage, and a simple conservancy system, attention to the first alone is mainly called for in South Canara (outside the few large towns). The fact that dwelling houses are generally scattered about necessarily mitigates or prevents the evils inseparable from the neglect of drainage and conservancy in the more compact and populous villages of other districts.

From the same circumstances, however, the number of public wells is very small, as most householders have one or more wells on their premises. This circumstance, while it renders cholera and other diseases capable of being propagated by specifically contaminated water less liable to spread, is in other ways a source of danger to public health; for the poorer classes, who are unable to provide themselves with good wells, sunk to a sufficient depth and protected against pollution by surface drainage, have to use water obtained from shallow wells or pits, which either dry up or contain only a small quantity of bad water in the hot season, or from the ponds and streams which irrigate paddy-fields and must, therefore, contain much organic matter both suspended and in solution. The continued use of such impure water must give rise to fevers and bowel-complaints, and hence it is desirable that Taluk Boards should expend some of the funds with which they are entrusted in the provision of good public wells in all the large villages, and that private individuals should be encouraged to undertake similar works of public utility.

		TOTAL		187,265	176,628	94:32

The foregoing statement shows the total number of operations performed by the several vaccine agencies in South Canara during the past five years. It will be seen that there was a heavy falling off in the outturn during 1889-90 as compared with the results of the previous year. No satisfactory explanation of this decrease is forthcoming. Since 1889-90, however, vaccination has been steadily progressing and the figures for 1892-93 are the highest on record. This great progress is attributed to the interest taken by the President of the District Board and by the District Medical officer in the matter. In 1892-93 the average cost of each successful case was in the case of Local Fund vaccinators, who do the bulk of the

work, 1 anna 11 pies, the average for the presidency being 3 annas and 5 pies. The number of persons vaccinated by each vaccinator Vaccination. has steadily increased, and in 1892-93 it was 1,684, the corresponding figure for the presidency being only 1,449. In the Mangalore municipality this average is lower and the mean cost greater.

CHAPTER VI.

EDUCATION.

CHAP. VI.
EDUCATION.
Census

statistics.

Or the total population of South Canara, no less than 976,399 persons are unable to read and write. The real number is somewhat greater, for in the case of 4,113 individuals the education column of the schedule was not filled up, and the majority of these are probably illiterate. The proportions of pupils, literates and illiterates in South Canara in 1881 and 1891 are compared below with the corresponding figures for the presidency.

Statement showing the Number of Pupils, Literates and Illiterates in 10,000 of each Sex.

			Ma	les.			Fen	ales.

^{*} Exclusive of the Agency Tracts.

It will be seen that South Canara occupies a much lower position in the scale of education of males than the presidency generally, while female education is apparently better cared for than in most districts. The proportion of uninstructed of both sexes has fallen since 1881, but the change in the case of females is slight, for even now only one in a hundred of that sex can read and write. Taking only the population of fifteen years of age and upwards, it is found that 82.82 per cent. of the males and 99.02 per cent. of the females are uneducated. Of boys between 5 and 9 only 9.79 per cent. were at school at the time of the census. the average for the presidency being 10.60 per cent. At the next age-period, 10 to 14, the proportion of boys at school was 13.75. per cent. in South Canara and 13:25 per cent. in the whole province. Of South Canara girls 2.00 per cent. of those between 5 and 9 and 1.63 per cent. of those between 10 and 14 were at school. The corresponding figures for the presidency are 1.51 and 1.19 per cent. respectively.

The following table shows the degree of diffusion of education CHAP. VI. in the several taluks :--

EDUCATION.

Census statistics.

Statement showing the Percentage of Pupils, Literates and Illiterates in each Taluk.

		Males.			Female	s.
Taluk.	Learn- ing.	Literate.	Illiterate.	Learn- ing.	Literate	Illiterate.
Amindivi Islands.	3.11	19.16	77:73	1.01	1.77	97.22

. Total	3.70	9.91	86.39	0.46	0.70	98.84

Uppinangedi contains the highest proportion of illiterates and Coondapoor follows close. Education is most advanced in Mangalore and Kásaragód. The proportion of illiterates in the Amindivi Islands is the smallest in the whole district, but the total population of these islands is only 3,722. Statistics of education for each main

religion are given in the margin. The Hindus are the most backward in education, the Musalmans. Christians and Jains being decidedly superior. Female education is little more than a name except among Christians and even among them term hardly denotes

anything beyond the mere ability to read and write.

It would appear from the census statistics given above that Progress of education is still backward in South Canara; but the returns of education. the Educational department show that considerable progress has been made in the last ten years. The number of institutions of all kinds has more than doubled, there are now nearly twice as many male pupils as there were a decade ago and female scholars have increased threefold in number. The total expenditure on education has risen in the same period from Rs. 83,091 to Rs. 1,59,294 and the expenditure on primary education from Rs. 30,001 to Rs. 54.848.

Education.

On the 31st March 1893 there were 579 institutions of all kinds. Of these 468 were public institutions, while 111 were private. Four schools are managed by the Educational department. 142 by Local Boards and 13 by the Mangalore Municipality. Of the rest, 232 were aided from public funds, 77 received no grantsin-aid, but conformed themselves to the departmental rules and 111 were purely private and indigenous institutions. The public institutions comprised 2 arts colleges, 5 high schools for boys and 1 for girls, 10 middle schools for boys and 2 for girls, 186 upper primary schools for boys and 3 for girls, 251 lower primary schools for boys and 6 for girls, and 1 training school for masters and 1 for mistresses. The 111 private institutions include 77 Qurán schools, 21 elementary vernacular schools, 6 Sanskrit schools and 7 special schools for Paraiyas and the kindred classes. on the whole 467 public or private primary schools in the district, which gives an average of 10 such institutions for every 23 villages. containing 200 inhabitants and upwards.

Pupils.

The total number of pupils on the 31st March 1893 was 20,457,

Statement showing the Percentage of Pupils in each Class of Institution.

	Pu	pils.
Class of Institution.	Males.	Females.
Colleges	. 0.64	T
High schools	. 3.06	0.47
Middle schools	. 4.81	3.65

Indigenous schools	. 1.23	5.64
Qurán schools	. 5.95	6.75
Sanskrit schools	. 0.41	
Total	. 100.00	100.00

of whom 17,482 were males and 2,975 females. The instruction afforded is mainly of an elementary character, for only 8.51 per cent. of the male pupils and 4.12 per cent. of the female scholars have passed the primary standard. It is, however, satisfactory to note that 79 out of the

108 female pupils reading in middle schools are learning English.

The marginal statement shows the race or easte section of the

Statement showing the Distribution of Scholars according to Caste, Tribe or Race.

Caste, tribe or race.	Males.	Females
Europeans and Eurasians	34	37
Native Christians	2,740	1,127
Musalmans	2,427	305
Bráhmans	4,797	715
Other Caste Hindus	6.518	771
Paraiyas	951	15
Others	15	5
Total	17,482	2,975

population from which the pupils are drawn. Nearly three-fourths of the students in colleges and more than onehalf of those in high and middle schools are Brahmans, and 22 out of the 42 masters in the training institutions are of this caste. Of the 81 girls in

CHAP. VI. EDUCATION.

English middle schools 65 are Native Christians and 6 out of the 14 school mistresses belong to this community. All the 27 girls in the vernacular middle schools are of this class. The state Pupils. of education among Musalmans is rather backward, for nearly one-half the number of male pupils of this religion are only attending Qurán schools, where very little real instruction is afforded. Of the 305 female pupils as many as 200 are found in these institutions.

The subjoined abstract shows the classification of pupils according to the occupations of their parents or guardians:-

	Pu	pils.
Class.	Number.	Percentage,
Officials	. 1,130	5.52
Petty officials	1,724	8.43
Traders	3,655	17.87
Landholders	10,537	51.51
Artisans	777	3.80
Coolies	1,583	7.74
Mendicants	175	0.85
Others	876	. 4.28
Total .	20,457	100.00

The proportion is very high for officials, for even including village servants in the term, the official classes constitute only 1.52 per cent. of the total population of the district. Traders form 13.87 per cent., landholders 50.01 per cent., artisans 5.94 per cent. and coolies 27.65 per cent. It will be seen that among landholders and traders the proportion of boys and girls under instruction is relatively high, while among artisans it is low.

There are 3,383 boys and 659 girls learning English. The statistics show an advance in the number of these students in the last three years, but only very few of them possess a real knowledge of the language. The number of pupils studying Arabic is high, and it may be assumed that all of them are Musalmans. Thus out of 2,427 Musalman boys, 1,065 are learning Arabic, and out of 305 female pupils 224 are studying that language. There are 111 girls who are learning Hindustani, and it is not clear to what class they belong: only 81 of them can be Musalmans if the above assumption regarding the Arabic pupils is correct. There are 150 pupils who are studying either Latin or Greek, and the majority of them are probably Native Christians.

CHAP. VI. Education. Financial.

The total expenditure on education in the district in 1892-93

Statement showing the Expenditure on Education in 1892-93 from each source.

Source.	Rupees.	Percent- age.
Provincial funds	30,795	19.33
Local funds	18,524	11.63
Municipal funds	4,782	3.00
Fees	58,627	36.80
Subscriptions	2,767	1.74
Endowments, &c	43,799	27.50
Total	1,59,294	100.00

was Rs. 1,59,294, and more than one-third of this amount was realized in the shape of fees. The sources of contribution are shown in the margin. Rather more than one-third was paid from public funds and about 29 per cent. from subscriptions, endowments, &c.

Again, of the total amount spent on education only 34.43 per cent. was devoted to primary schools, while a little over 19 per cent. went towards collegiate instruction. The average cost per pupil was Rs. 7-12-7, and Rs. 2-10-4 of this was paid from public funds, Rs. 2-13-10 by parents in the shape of fees and the rest from subscriptions, endowments, &c. The cost of educating a boy or girl does not amount to even 4 annas a month.

CHAPTER VII.

COMMUNICATIONS.

THE total length of roads in the district on the 31st March CHAP. VII. 1893 was 1,811 miles, and there are only four districts in the presidency which have a larger mileage than this. The chief roads are the coast road from Baindur to Cavoy, which is 135 miles in length; the Calicut-Panemangalore road which traverses the Kásaragód taluk, passing through Hosdrúg and Vittal; the road from Mangalore to the Mysore frontier by the Sampaji ghát; the road from Mangalore to the Mysore frontier via Agumbi ghát, which passes through the taluks of Mangalore and Udipi; and the Kodikal ghát road viá Chármadi to Bantvál, which runs through the Uppinangadi and Mangalore taluks. Details of the roads in each taluk will be found in the gazetteer portion of this volume. A statement showing the total outlay on roads during each of the last five years is subjoined: —

Year.	Village.	Taluk.	District.	Total.
	Ŗs.	RS.	RS.	RS.
1888-89	3,675	34,764	51,554	89,993
1889-90	4,872	38,220	42,265	85,857
1890-91	3,224	35,285	33,362	71,871
1891-92	6,770	32,018	33,360	72,148
1892-93	6,720	27,224	33,712	67,656

In the beginning of the year 1892-93 there were 437 miles of road with avenues, the number of trees being 77,075. The cost of maintaining them is more than covered by the sale-proceeds of their produce.

There are at present no railways in Canara and it is now the only district in the presidency without them. The need of them is great and several lines have been suggested. One project is to

CHAP. VII.
RAILWAYS.

connect Mangalore with the Madras Railway system by a coast line from Calicut vià Mahé and Tellicherry; another is to connect with the Southern Mahratta system by a line from Mangalore to Tiptúr, or Mangalore to Mysore, with a continuation, vià Nanjangode, to Erode on the South Indian and Madras Railways. These projects are now being investigated.

Post.

There is only one head office for the district, which is situated at Mangalore. There are seven sub-offices, besides 22 branch offices. The annexed statement contains statistics of the Savings Bank transactions of the post offices in the district for each of the last three years. It will be seen that the amount deposited is generally highest in March and April, and the amount withdrawn largest in the former month. The deposits rose from Rs. 1,17,382 in 1891–92 to Rs. 1,25,125 in 1893–94, while the withdrawals fell from Rs. 1,09,406 in the former year to Rs. 1,02,119 in the latter.

TELEGRAPH.

The telegraph line which passes through the district forms part of the line which runs from Mercara to the coast and thence southwards to Calicut. There are four offices in the district in which messages are received and transmitted. All of them are combined offices, i.e., offices in which the telegraph department forms a part of the Post office. The length of telegraph line running through the district is not known.

¹ This project has lately been favourably considered by the Government of India.

CHAP. VII.

Savings Bank transactions. CHAP. VII. Buildings.

Travellers' bungalows.

There are 28 bungalows in the district for the accommodation of travellers. Of these, the one at Mangalore is in charge of the . Municipality, while the rest are under the control and management of Local Boards. Mangalore contains five bungalows, Kásaragód, Udipi and Uppinangadi seven each and Coondapoor two. Eleven out of the 28 bungalows are fully furnished; seven are partially furnished, while the remaining ten have no furniture at all. In none of them are meals supplied, and the traveller has, therefore, to make his own arrangements. The bungalows are open to all travellers alike, public officers having no preference over non-The fees generally charged are one rupee per diem for a . single person, and a rupee and half for a married couple. In the bungalows at Baindúr, Kirimunéshwar, Múlki, Káp, Kárkal, Udipi, Chármadi, Mudradi, Brahmáwar and Alladi, however, the fees charged are at half these rates, while in the case of the bungalow at Hiriyadka the fees are only four and six annas respectively. In addition to these public bungalows there are a number of resthouses maintained by some of the district officers, who subscribe to a fund for the purpose. These buildings are not open to the public.

Chatrams.

The district contains 64 chatrams for the accommodation of native travellers. In 25 of them meals are supplied free to travellers, while the remaining 39 are mere buildings where the traveller can halt and obtain shelter and rest to his wearied limbs. The annexed lists give detailed information regarding the situation of the various bungalows and chatrams in the district, and of the nature of the accommodation available in each.

and storage	2.00	2.47		
F.—Professions	2.83	2.03		
G.—Indefinite occupations	11.43	9.92		
Total	100.00	100.00		

depending on several classes of occupations. The statistics have been compiled from the census tables of 1891, and include not only persons who actually exercise an occupation, but alse those who · subsist by it. As in other districts of the presidency. 80 South Canara, agriculture is by far the most important occu-

pation; more than three-fifths of the inhabitants are dependent for their livelihood on 'Pasture and Agriculture,' and a higher proportion is found in only eight districts. The total number of these is 644,634, and there are, besides, a number of persons who possess an interest in land in addition to some other calling. Further, it is probable that many of the 108,000 persons who returned their occupation as general labourers are, in reality, engaged in agricultural operations for at least part of the year. Of the 644,634 persons shown under 'Pasture and Agriculture,' 8,384 are dependent on the former. Of these 7,641 are herdsmen and 319 are farriers and gelders. Many of the so-called 'herdsmen' are children employed in tending cattle, sheep and goats.

Of the 636,250 individuals who depend mainly on agriculture

Land occupants (not cultivating) 22,387

Land occupants (cultivating) 148,494

Tenants and sharers (cultivating) 344,421

Farm-servants 21,121

Field-labourers 85,556

for their livelihood, more than onehalf are cultivating tenants, while land owners number only 171,000. The high proportion of tenants is evidently due to the peculiar system of land tenure which obtains in the district. Agricultural labourers

are relatively few, and form but one-fifth of the total number of CHAP. VIII. persons who have some kind of interest in land. Nearly 20 per Occupations. cent. of the agricultural labourers are farm-servants who are Agriculture employed throughout the year; the rest are engaged for special work only, such as transplanting and harvesting, or if employed longer, are paid by the month, and can be dispensed with when work is slack.

An account of the agricultural methods pursued by the people of South Canara will be found in the first volume.

Next in importance to agriculture is the preparation and supply Preparation of material substances. Persons engaged in these occupations and supply of material subnumber 207,161, of whom 113,892, or more than one-half, are stances. employed in preparing and supplying articles of food and drink. There are 31,903 toddy-drawers and sellers, besides 13,375 persons engaged in the manufacture and sale of jaggery. This is, not strange seeing that the cocoanut and palmyra palms are very common throughout the district.

Toddy-drawing is the chief means of subsistence of the Billavas Toddy-drawand Halepaiks, who correspond to the Tiyyans of Malabar. Toddy ing. is drawn from the cocoanut, palmyra and sago palms, the two latter yielding more than the former. A man can, on an average, tap from 15 to 20 trees a day, and his daily income from this source, after deducting the charges, which consist chiefly of the tree-tax, ranges from 4 to 8 annas.

Jaggery is manufactured either from sugar-cane or from Manufacture toddy, and is mostly used for local consumption. The sugar-cane of jaggery. required for the manufacture is cultivated by the manufacturers themselves. The canes are crushed in country-made mills and jaggery is obtained by boiling the juice in iron pans. The jaggery

Cost of cutting the canes 12 Rent of land Cost of crushing the canes and boiling the juice ... Price of firewood

thus manufactured fetches, on an average, about Rs. 120 per ton. Sugar- . cane grown on a plot of ground about 25 cents in extent will ordinarily yield ton of jaggery, and the cost incurred in the manufacture of this quantity amounts to Rs. 28, which leaves a net

profit of only Rs. 2 to the cultivator.

* The manufacture of jaggery from toddy is confined to professional toddy-drawers. The toddy intended for this purpose is drawn in lime-coated pots, and it is then boiled and converted into jaggery. About 100 quarts of toddy are capable of yielding three-fourths of a maund of jaggery, which ordinarily fetches Re. 1. The charges incurred in the manufacture are as follows:—

CHAP. VIII.	19.11님, 일본 1일 나는 그는 나는 사람들은 그리는 어느	RS.	A.	P.	
OCCUPATIONS.	Wages of two men required for drawing				
	100 quarts of toddy	0	8	0

or luggery.	Value of lime-coated pots	0	0	6	
	Cost of firewood	0	4	0	
	Wages of a woman for boiling the toddy	0	2	0	
	이 말은 이 아이, 그들은 다양했는 말하다니? 그림을 모수				
	Total	0	15	6	

Food and drink.

Next in importance to toddy-drawers and manufacturers of jaggery are betel-leaf and areca-nut sellers, of whom there are 7,079 in the district. The sale of tobacco and snuff supports 1,950 persons, while 1,002 individuals derive their support from the sale of salt. These articles, however, are extensively sold in the 'chillara' or miscellaneous shops, the keepers of which are shown under the head of 'grocers and general condiment dealers.'

Coffee curing.

The preparation and sale of coffee constitute the chief means of livelihood of 1,603 persons, most of whom are found in Mangalore. This town is the centre of the coffee trade, and much of the coffee produced in Mysore and Coorg finds its way there. There are three coffee curing factories in Mangalore, which are owned by Messrs. Morgan and Sons, Arbuthnot and Company, and Saldanha and Sons. They are worked for five months in the year, viz., from December to April, and the average number of coolies daily employed in them is estimated at 1,300, while the quantity of coffee cured in the factories during the working season is estimated at 2,000 tons. The cost of curing a ton of parchment coffee amounts to Rs. 23-10-0, and is made up of the following items:—

	RS. A. P.
Peeling, winnowing and sizing	9 10 0
Cost of picking	9 0 0
Other expenses	5 0 0
* Total	23 10 0

All the coffee cured in Mangalore is exported to England and to the continent, but there is nothing to show with what profits the business is conducted by the proprietors of the factories.

A large number of men are also engaged in picking the pounded native coffee, the cost of which is estimated at Rs. 9 per

ton.

Animal food.

Of persons who provide and sell animal food, fishermen are numerically the most important. There are 31,422 persons engaged in catching, curing and selling fish, while the strength of

the fishing castes is 39,402. Cow and buffalo keepers, including CHAP. VIII. milk and butter sellers, number only 209, while there are only Occupations. 138 ghee preparers and sellers. It is, in fact, only in towns that Animal food, these articles are provided by special individuals; in villages they are produced at home, or, if purchased, they are bought from a ryot whose chief means of subsistence is agriculture.

There are only 94 butchers in the district, and this small number is evidently due to the fact that the consumption of meat by the ordinary population is not enough to keep a butcher in regular employment. The majority of them are found in towns.

Coming next to vegetable food, we have 526 vegetable-sellers vegetable and 654 fruit-sellers. The ordinary vegetables eaten by the people food.

The fruits chiefly sold are cocoanuts, plantains, oranges and mangoes.

Oil-pressers and sellers number 7,380. Oil is generally ex- Oil-pressing. pressed from dried cocoanuts, called khobri, and to a limited extent from gingelly seed, both kinds of oil being used for culinary purposes as well as for lamps. Cocoanuts are removed from the shell. well dried and then cut into thin slices, which are put into the mill for extracting oil. Gingelly seed is cleaned, dried and thrown into the mill. Oil is also expressed from the seeds of certain plants and used for lamps. It is obtained by boiling the seeds in earthen chattis. The oil thus extracted does not give a clear light and is used only by the poorer classes. The apparatus of the country mill is very simple. It is made of the trunk of a large tree, either

OCCUPATIONS. Oil-pressing.

CHAP, VIII. tamarind or jack, which is hollowed into the form of a mortar and planted on a raised piece of ground. In this a big pole works as a pestle round and round, being drawn by men or bullocks voked to a projecting spar. The mill is worked only as occasion requires and not continuously, the local demand for the oil in question being limited by reason of the large imports of kerosine oil, which, being cheaper, is extensively used for lamps, so that the ailmongers. manufacture cocoanut and gingelly oil to order rather than for sale. The workers of the mills are not paid in each except in the Uppinangadi taluk, where they get 4 annas for every 100 cocoanuts and 12 annas for each mura of gingelly seed crushed in their mills. Elsewhere they give the oil extracted from the cocoanuts or gingelly seed to the suppliers and retain the oil-cakes for themselves as their remuneration. In the Kásaragód taluk the oilmongers enter into a contract with the suppliers of cocoanuts and gingelly seed, and the terms of the contract are generally as follows:-In the case of cocoanuts they give 1 kutti or 9 kudtas of oil for every 16 cocoanuts supplied to them, and in the case of gingelly 1½ kudtas of oil for every seer. In either case the oil-cake goes to the labourer, and he is also entitled to any excess quantity of oil over the contract rate which the material supplied to him may yield. He can press about 100 coccanuts or 40 seers of gingelly oil in a day, and his average income amounts to 4 annas.

> In addition to these country-made mills, which are found in almost every village, a machine for extracting oil, which is worked by steam power, has been lately introduced in Mangalore, and it is capable of yielding 8,395 maunds of oil in a year, the corresponding outturn of the ordinary mill in use being only about 200 maunds. It is worked by its proprietors on the same conditions on which the native mills are worked.

· Pottery.

There are 7,877 potters. The ordinary pottery of the country is produced in every village and needs no description; but in Uppinangadi a superior kind of pottery is manufactured by a class of potters who are known as Kannada Kumbáras or Canarese-speaking Kumbáras, as distinguished from the Kumbáras who speak Tulu. The former class are not generally found in other parts of the district, but there are two or three houses of them in the village of Perdúr in the Udipi taluk.* The pottery produced in Uppinangadi is superior in quality to that met with in other places and is made of clay powdered, mixed with water and strained. It is then poured into a pit specially prepared for the purpose, where it is allowed to remain for about a month, by which time it becomes quite dry. It is then removed, powdered, moistened and made into balls, which are one by one placed upon a wheel and

fashioned into various kinds of vessels, including vases, goglets, CHAP. VIII. tea-pots, cups and saucers. The vessels are dried in the shade for Occupations. about eight days, after which they are baked for two days, when Pottery, they are ready for sale. They have a glazed appearance, and are sometimes beautifully ornamented. The ordinary earthen vessels, however, are generally used by the poorer classes on account of their cheapness. A potter earns, on an average, about 5 annas a day.

There are 1.097 brick and tile burners and sellers in the district. Tiles. The ordinary old fashioned country tiles, which are found in all parts of the district, are made of clay by potters. Clay is moistened, rounded and moulded into the shape required and then baked in the oven. These tiles, however, are gradually being supplanted by machine-made tiles, which find favour with the inhabitants on account of their lightness, size and durability. There are eleven factories in the town of Mangalore for the manufacture of. machine-made tiles, bricks and pottery, in which about a thousand coolies, consisting of men, women and boys, find employment daily. Of these factories two are managed by the Basel Evangelical Mission, one by Messrs. Morgan and Sons, and the remaining eight by native Roman Catholics of Mangalore. The probable annual outturn of the factories is shown below:-

Tiles, first class	6,220,000
Tiles, second class	300,000
Tiles, third class	400,000
Ridge-tiles	200,000
Bricks	300.000

The following are the rates at which the tiles and bricks are sold by the manufacturers:-

 Tiles, first class, per thousand Rs. 35 to Rs. 4	15	
Tiles, second class, per thousand, 25 to 8	35	
Tiles, third class, per thousand Rs. 1	5	
Ridge-tiles per hundred ,, 8	30	
경우하다 하다 그는 전에 어느를 하는 것 같아. 얼마나 그렇게 하는 것이 하면 살아보고 있는데 어느를 되는 것이 없었다.	35	

These tiles and bricks are made of a peculiar kind of clay found higher up the Nétravati river, which is now in great demand among the manufacturers. They are baked in kilns, each of which is capable of holding 2,500 bricks or tiles in their raw state, and the

TOTAL ...

Sundries *	

cost of manufacturing this number amounts to about Rs. 61. Almost all the tiles and bricks manufactured in these factories are exported by sea to Bombay and to the other ports on the West Coast.

CHAP. VIII. Tiles.

In one of the Basel Mission tile factories at Mangalore pottery Occupations. of a superior kind is occasionally manufactured, while ornamental pillars, rails and other fancy articles are commonly made, besides drain-pipes of various sizes and shapes.

> A branch of the Basel Mission at Mangalore has recently opened a tile factory at Malpé in the Udipi taluk, which, besides supplying the local demand, exports a large quantity of machine tiles to Bombay and to places above the ghauts. This factory, which employs from 130 to 230 men a day, turned out 60,000 bricks and 900,000 tiles during the year 1893, valued at Rs. 23,400 at an estimated charge of Rs. 18,600.

Machine tiles are also manufactured, though on a small scale, in Coondapoor, by Vyásáchári and Company. They are made of clav. brought from the villages of Balkur and Gulvadi, which lie within a distance of 6 miles from the town of Coondapoor, wherein the

			Num- ber.	Price

factory is located. Bricks are also manufactured in this factory, and the process of manufacture is similar to that in the Basel Mission factory at Mangalore. The company has an engine of 8-horse power. It appears that, on an average, 7 persons were employed every day for a period of about 51 months in 1893, and that they turned out 16,200 ordinary tiles, 200 ridge-tiles and 5,000 bricks, with an estimated value of Rs. 686-8-0. The cost incurred in manufacturing the above amounted to Rs. 600. thus leaving a net profit of only Rs. 86-8-0 to the proprietors.

Details of charges incurred.

	s.
Cost of conveyance of clay 10	0
Cost of firewood 20	0
Cooly wages 30	0
Total 60	0

No work is carried on in this factory during the monsoon months, as sufficient space is not available for drying the tiles

during those months. It will be seen that the manufacture is CHAP. VIII. conducted on a very small scale and this of course affects the rate Occupations. of profit. The tiles are exported chiefly to Bombay, but are also Tiles. sometimes sent to Mysore and are sold locally. They are said to be inferior in quality to those manufactured at Mangalore.

There are 238 printers (including press proprietors) and 197 Printing. book-binders, most of whom are found in Mangalore. This town has two printing presses, of which one is managed by the Basel Evangelical Mission and the other by the Jesuit missionaries. A large amount of work is turned out in both of them. Attached to the printing presses there are two book-binding establishments in which a large number of people are employed. It is said that these businesses are worked at considerable profit, but it has not been possible to obtain fuller information regarding the actual receipts and expenditure.

preparation and sale of wool, 'silk, cotton, jute, flax and coir is 13,020, and of this number 5,791 appear under the head of cotton weavers. The return is probably defective in the case of some of the industries insmaller cluded in this group, for when the entry in the schedule was simply weaver, it was taken to be a *cotton weaver. though several of them were, no doubt, weavers of silk fabrics, blankets, &c. The strength of the weaving and dyeing

castes is 9,495, which is less than the number of persons who live by weaving, dyeing, &c. It may be concluded with a fair amount of confidence that weavers have not been driven to other occupations, as is so often alleged, by the competition of Manchester goods. The Jádas and Sáles are the most numerous of the weaving castes and produce only the common country cloths worn by the people. The process of weaving is very simple. English thread is almost entirely used except in the southern parts of the taluk where thread is manufactured out of cotton grown in kumari lands. The

Weaving.

CHAP. VIII. thread is bought by the weavers from the local bazaars which OCCUPATIONS. import it from Bombay. The thread is at first rolled upon a spindle and a warp is formed out of it. Two posts are planted at each end at a given distance in an open shady place and split bamboo laths are tied to them breadthwise, with bamboo pieces in the middle as a support to the warp. A woman sets the warp by walking up and down the frame with the spindle in her hand and arranging the thread upon the frame. After the warp is thus formed starch made of rice and a bulb similar to the Bombay onion (called in Canarese 'Naiulli') boiled together is applied to it with a piece of cloth made into a sort of roller. The warp is then gently gone over by a kind of brush made of the roots of grass. When the warp gets dry, which it does not take long to do, it is rolled up at both ends and placed in the loom in the weaver's house. The weaving room is a long and narrow chamber with only a small window just where the workman sits. The loom used is the ordinary native loom, to * be found everywhere, which costs about Rs. 25 a pair, one large and one small being indispensably necessary for a man to work. It is constructed on the simplest principles and can be taken to pieces in a few minutes, forming a light load for a man. The alternate threads of the warp are raised and depressed to receive the woof in the following manner. Two pairs of bamboos are joined together by thin twine loops, and, being suspended from the roof, are also joined to two pedals near the floor. Through the joining loops of one pair of bamboos run half the threads, and through those of the other run the other half; thus by depressing one pedal with the foot and raising the other, one set of threads is depressed and the other raised so as to admit of the woof thread-spool being shot across. This thread is forced home by a light beam suspended from the roof and then, the position of the pedals being reversed,. the woof thread is sent back again between the reversed threads of the warp. In this way, one man can weave in a day a piece of cloth about 3 yards by 1 yard. The thread required for it is half a pound which can be purchased for 31 annas, and the wages of the woman amount to 2 annas. The cloth will fetch in the market about 8 annas, so that the net earnings of the weaver amount to about 2½ annas per diem. The cloths manufactured are seldom exported, but are almost invariably used for local consumption.

A large amount of weaving is done in the Basel Evangelical Weaving establishment at Balmatta in Mangalore, the converts being engaged in the work. Towels, napkins, table-cloths, sheets, imitation tweeds and many other kinds are here turned out, and are sent to all parts of India, the reputation of the Mission in this branch of industry being a high one. Weaving is also carried on to some extent at the St. Joseph's Orphanage at Jeppu under

the superintendence of the Jesuit missionaries. The Basel Mission CHAP. VIII. has 70 looms, and about 53,000 yards of cloth are manufactured Occupations. annually. .The average selling price of each yard is 10 annas, the Weaving. expenses incurred in weaving the same amounting to 9 annas and 3 pies. The proprietors thus realize a clear net profit of 9 pies on every yard of cloth manufactured in their looms.

According to the census returns, more than 5,000 persons depend Coir-making. for their livelihood on the manufacture and sale of coir. industry is chiefly carried on in Coondapoor, Udipi and Mangalore. It is not confined to any particular class of people, but is carried on · by members of different castes always in addition to some other occupation such as agriculture or trade.

The process of preparing the coir is as follows:-The husks of coccanuts are buried in the marshy places of the beds of rivers, called 'ghaznis,' in the hot season, and are allowed to remain there and rot for about six months, after which they are removed at the commencement of the rainy season. They are then beaten down with a wooden hammer and dried in the sun for a day or two. The yarn is next separated, the dust being thrown away. The yarn is then twisted into cords of various thickness. A piece of cord about 2½ yards in length is tied up into a small bundle, and 100 of

	RS.	A.	P.

Cost of twisting	3	4	6
Total	15	0	0

these small bundles make a big bundle. Sixty-three big bundles weigh about a candy, the selling price of which is, on an average, about Rs. 20. Three thousand cocoanut husks yield one candy of coir which is always sold by weight in wholesale transactions.

The cost of preparing this quantity amounts to Rs. 15, so that there is a net profit of Rs. 5.

Of the several processes detailed above, the twisting work is done by females and children above five years of age of the Mogér, Halepaik, Khárvi, Máppilla and Holeya castes and of poor Roman Catholic Christians, while the rest is done by almost all classes of people. The twisting work is not done by adult males, except those that cannot do other work, because it does not pay them, and the females only resort to it when they have no other work that pays better. This is assigned as a reason for the manufacture of coir being commenced soon after the fields are planted and carried on during the monsoon months. A woman earns about an anna a day and a child half that amount.

There are no statistics to show the actual amount of coir produced yearly in the district, but it appears from the trade returns that Workers in metal, wood

and stone.

CHAP. VIII. about 1,500 candies of coir are exported annually from the ports of Occupations. Coondapoor, Malpé and Hangarkatta.

> The manufacture of articles from metal, wood and stone is almost entirely confined to the five artizan castes which are collectively known as Kammálas or Pánchálas, though they themselves assume the ambitious appellation of 'Visvakarma' or 'Visva Bráhmana.' These five castes are the goldsmiths, the brass and copper workers, the blacksmiths, the carpenters and the masons. Goldsmiths number 10.347, workers in brass, copper and bell-metal 2,026, blacksmiths 2,197, carpenters 10,876, and masons 3,565. The goldsmiths make the ordinary ornaments of the people, but there is no special work of this kind peculiar to South Canara.

Iron.

A large variety of articles, chiefly agricultural implements, is made out of this metal. The blacksmiths who manufacture them are, for the most part, of the Kammara caste. Iron is purchased in the local bazaars and manufactured into different articles as required. A blacksmith's earnings vary from 4 to 10 annas per day. Iron is generally supplied to him by those who want the articles and he is paid at a rate fixed for each article.

The workers in the different metals will be noticed separately.

Copper.

This industry is carried on chiefly in towns. Several of the coppersmiths are not natives of the district, but are settlers from Goa. Copper is purchased in big sheets which are imported by merchants from Bombay and other places. The sheets are cut into pieces and converted into vessels of different sizes and shapes. These articles are sold by the weight, a maund fetching Rs. 14-8-0.

Price of copper sheets ... 12 0 0 Cost of two muras of charcoal 0 12 0 Hire of three workmen ... 1 0 0 Other charges

The cost of manufacturing vessels weighing one maund amounts to Rs. 14-0-8, so that the manu-... 0 4 8 facturers derive a net income of As. 7-4 on every maund worked up by them. . The average in-

come of an adult male may be estimated at 7 annas a day.

TOTAL ... 14 0 8

Bell-metal.

Bell-metal is largely used for making household utensils, such as lamps, goglets, basins, jugs, &c. The process of manufacturing these articles is as follows. The moulds are made of clay and dried and coated with wax to the thickness of the articles required and again left to dry well. They are then covered with clay and left to dry again, a hole being made in them so as to allow the wax to flow out when heated. After this has been done, the molten metal is poured in. The moulds are then broken and the articles taken out and polished. Workers in this metal are called Kanchugáras and their average daily earnings are about the same as those of the coppersmiths.

Silver and gold are used for little else but the manufacture of CHAP. VIII. The workers in these metals are known by different Occupations. names, such as Akkasáles, Sonárs, Ponnasettis and Tattáns. The Silver and ornaments are, as a rule, manufactured to order on supply of the gold. raw material, the rate of hire varying in the different cases with reference to the skill and labour required. The average income of a goldsmith of ordinary skill may be estimated at from 4 to 12 annas per day.

The chief wood-work known in South Canara is the ordinary Woodcarpentry. Carpenters are chiefly engaged in making building materials and articles of furniture. Work in wood, however, is not confined to the artizan castes as in the case of gold and silver, and a class of people known as Cháródis, as well as some Goanese. carry on the profession to a greater extent than the Acharis. The daily wages of a carpenter range from 8 to 14 annas according to the nature of the work done.

A grinding stone made of granite is an article peculiar to Stone. South Canara. It is a semi-circular, oval-shaped block with a flat bottom and a round hole in the middle of the surface. It has another oval-shaped block, thin and long, with one end so shaped . as to fit into the hole in the larger block. These two together make what is known as the grinding stone of the district, which is used for grinding curry-stuff, rice, wheat, &c. The price of a stone varies from Rs. 1-8-0 to Rs. 4. A grinding stone of ordinary size takes about 4 days to make, and the average earnings of the labourer amount to 12 annas a day. Mill stones for pounding grain are also made of granite. Formerly, a class of people called 'Kallukuttis' used to make such articles, but the industry is now taken up by other castes as well. Mile stones, slabs for temple door-frames, idols and other figures for temple purposes are also made of granite.

There are 4,283 basket-makers and 2,425 mat-makers. Baskets Basket and are made of bamboos, rattan and wild creepers by people belonging mat-makers. to the Holeya, Rányadava, Bellera and Koraga castes. The materials used are split into thin strips and interwoven into different sizes and shapes. The price of these baskets is moderate, ranging from 6 pies to 4 annas. The average daily income of a person engaged in this industry is about 2 or 3 annas.

A rough kind of mat, made of bamboos or reeds, is used for Grass mats. protecting stocks of grain or to cover country carts. Those of a superior quality used for ceilings are imported from Malabar. These are made of a grass called dore, which grows in marshes by the side of rivers, and from the leaves of a wild screw pine, known

OCCUPATIONS. Grass mats.

CHAP. VIII. as mundagi in Canarese, which grows by the side of water courses or field banks. They are also prepared from the leaves of a plant called Ichalagida, which grows on hills in the north-eastern parts of Udipi. The leaves of the plants are dried and exposed to dew. The prickly edges are removed and the leaves split into thin strips after which they are soaked in water and woven into mats of different sizes. The industry is extensively carried on by the females of different classes, such as Holeyas, Kúsas, Máppillas. Bants, Sérvégáras, goldsmiths, carpenters, &c. The price of an ordinary mat varies, according to the size and quality, from one to eight annas. The daily earnings of a woman exclusively engaged in this occupation will be about 4 annas.

Manufacture of catechu.

There are 181 persons engaged in the preparation and sale of This industry is peculiar to South Canara and is carried on mainly in the Coondapoor taluk. Catechu is manufactured out of the tree called 'catechu tree,' which is of a moderately small size with bipennate compound leaves. It is not cultivated, but grows naturally on all soils except those in which sand predominates, that on the laterite soil being the pure species. It is confined mostly to the villages north of the Wandse river and of the Sankaranárávana-Hosangadi road. It is rare in the other taluks of the district. The heartwood of catechu is said to be more durable than teakwood, but it is scarcely used for timber, as the tree seldom grows straight or attains the dimensions necessary for yielding timber and as it is considered more valuable as yielding the 'cutch,' usually called catechu, which is obtained from its heartwood. The right of manufacturing catechu is vested in the Forest department, which controls the cutting of the trees. The ryots are not permitted to fell catechu trees except those standing on their own warg lands. The privilege of manufacturing catechu from the trees standing on Government lands is let out on contract, every tree to be felled being inspected and marked by an officer of the Forest department appointed for the purpose, a precaution introduced in recent years to guard against indiscriminate felling by the contractors and to ensure the existence of mature trees in the next rotation in view to the continuity of operations. The contractor agrees to deliver to the department the quantity of catechu specified, within the stated time and at the lowest price per ton. The following is a brief account of the mode of preparing catechu. The catechu trees are felled, and their branches and sapwood removed. The heartwood is then chopped into small chips about $1\frac{1}{2}$ inches by 1 inch in size. About 21 maunds of chips are put into an earthen pot containing a maund of water and boiled for two hours. When the active principle of catechu has separated from the chips, the decoction is

strained into a trough placed at the foot of the still and immedi- CHAP. VIII. ately transferred to another vessel of which about half-a-dozen are Occupations. *placed on the ovens in a line. The chips once boiled are again Manufacture mixed with the same quantity of water and again boiled. The of catechu. process of boiling and straining is repeated six times and at every time the decoction obtained is strained and transferred to the pot containing the former decoction. The decoction is itself boiled again for about six or seven hours until it attains a dark brown colour and becomes gummy. It is then discharged into an open, shallow vessel and stirred by a ladle until it becomes semi-solid by oxidation, which it does in about five or six hours. It is made into balls, each of 11 inches in diameter and the balls are rolled in ashes. The above preparation is said to produce 45 balls weighing $10\frac{1}{2}$ lbs. Here ends the work of the people—males and females of the Kudubi caste—engaged for the purpose. After receiving the balls from the Kudubis the contractor has to go through a further process of rubbing them five or six times for two or three days, heaping them up in an air-tight covering of ashes, in which state they are kept for three or four days, and then giving them another rubbing, after which they are spread out in the shade to dry; when dried the above 45 balls weigh about 9 lbs. The balls thus prepared are delivered over by the contractor to the Forest department, which pays him the price agreed upon, viz., Rs. 60 per candy, about 3,000 balls making a candy.

The manufacture of catechu is carried on from about the end of December to the middle of March. It is confined to a jungle tribe, called 'Kudubis,' who speak a dialect of Konkani and are said to have migrated into the district from Goa when it came under the sway of the Portuguese in the sixteenth century. When the Kudubi is engaged in the manufacture of catechu, he makes the site of the stills his home, the Kudubi woman being as much essential for the work as the Kudubi man. The work of the male ends when he has felled the trees and cut the heartwood into chips; all the rest of the process until the catechu balls are delivered to the contractor falling to the share of the female. The Kudubi gets from Re. 1 to Rs. 1-4-0 for every 100 balls manufactured or Rs. 40 to Rs. 50 for every 4,000 balls which is generally the unit of account between the contractor and the Kudubi. During the three years ending with the 31st March 1894, about 49 tons of catechu were manufactured at a cost of Rs. 11,630 and the sale of these realized Rs. 25,857, leaving a total profit of Rs. 14,227 or Rs. 4,742 per annum to the Forest department. The manufacture of catechu gives employment to nearly fifty or sixty families of Kudubis, and the average monthly income of a family amounts to about Rs. 8.

CHAP. VIII.

Manufacture of catechu.

The catechu manufactured in South Canara appears to com-OCCUPATIONS. mand a higher price than the product of Mysore on account of the careful and neat method employed by the Forest department in its. preparation; the former fetches Rs. 135 per candy, while the latter scarcely realizes more than Rs. 100. The catechu manufactured in South Canara is chiefly sold in Mysore where it is eaten with pan (betel-leaf) and administered as a medicine to women immediately after confinement. It is also said to be used by tanners.

Leather.

Workers in leather number 2,498. Of these 1,911 are shoe and sandal makers and 493 are tanners. The tanning industry is chiefly carried on by Sámagáras, and their modus operandi is as follows :--

The hides are soaked for a period of one month in large earthen vats containing water to which chunam is added at the rate of 2 seers per hide. After the expiry of the above period, they are soaked in fresh water for three days in view to the chunam being removed. They are then put into an earthen vessel filled with water and the leaves of the Phyllanthus emblica, in which they remain for twelve days. After this they are removed and squeezed and replaced in the same vessel, where they are allowed to remain for about a month, after which period they are again removed, washed and squeezed. They are then sewn up and stuffed with the bark of cashew, daddala and neralé trees and hung up for a day; after this the stitching is removed, and the hides are washed and exposed to the sun to dry for a day, when they become fit for making sandals. Some of the hides rot in this process to such an extent as to become utterly unfit for use.

A man can make in a month 15 pairs of sandals out of 5 hides which cost him about Rs. 17-8-0, including the tanningcharges at one rupee per hide. Each pair of sandals sells at Rs. 1-8-0, so that his net profits may be estimated at about Rs. 5 per mensem.

The professional classes.

The priesthood supports 4,925 persons, and the subsidiary services connected with religion 8,067 individuals. Teaching affords subsistence to 2,584, while the lawyers, including every class of pleader, number only 978. The native doctors and their families number 957, and there are 99 persons supported by midwifery. Music, acting and dancing afford subsistence to 3,999 individuals. and astrology supports only 512. Exercists, hail-averters and amulettiers number 3,495 or more than 3 per cent. of the total population. The large number returned under this head is evidently due to the widespread practice of devil-dancing which obtains in the district. There are altogether 29,822 persons dependent on professions for their chief means of livelihood, but as

will be seen, some of the callings which are classed as professions CHAP. VIII. in the census tables do not require much knowledge or special Occupations. training.

Allied to the professions is the public service. The total Administranumber under this head is 16,000, but 6,000 of these are village servants. Of the remainder nearly 2,000 are soldiers, 5,000 are peons, police constables and the like, and 2,000 are clerks, subregistrars, police inspectors, &c. The number of persons supported by State pensions is 1,118; these are not included in the figures given above,

Nearly 110,000 persons are dependent for their livelihood on Indefinite. 'general labour,' but as already observed most of them are probably agricultural labourers. Rice-pounders and huskers number 6,289 and mendicants 2,805. The actual number of beggars is considerably greater than this, for several of them are included under the head of religion, and many have no doubt returned some occupation other than mendicancy.

Commerce, including the transport and storage of materials, Commerce. supports 21,000 persons, but of these only 4,000 are engaged in commercial transactions. Of the remainder 5,000 are cart owners and drivers and 5,000 are boat and bargemen. There are over 3,000 porters, and nearly a thousand individuals have returned themselves as 'packers.'

The number of domestic servants is not large. There are, for Personal example, 1,910 cooks, while the number of inhabited houses is 189,584. It will be seen how very few houses have a hired servant to do their cooking, for the above number includes not only persons who actually cook, but all those dependent on them. The number of other in-door servants is 4,421, and of these 2,584 are females. There are 267 persons under the head of grooms, coachmen, dog-boys, &c., and 1,149 under that of gate-keepers.

Turning to the personal services which are rendered to more than one household by the same individual, we have first the barbers who number 4,385. The washermen (3,159) are the only other important class of this kind, but the tailors should, perhaps. be included; there are 1,565 of them.

The subjoined table shows for each taluk the numbers subsist- Taluk ing by the principal occupations. The system of classification differed slightly from that adopted for the Imperial census tables, but the discrepancies between the two sets of figures are not great :-

Statistics of land trade are compiled, not for separate districts, CHAP. VIII. but for blocks, and it is, therefore, impossible to give any information regarding the volume of the exports and imports of South Canara. The chief exports are cocoanuts, oils, Indian piece-goods, ironware, tiles, salt and fish, while the most important imports are rice, paddy and ragi, European piece-goods, coffee, chillies, ironware and cattle.

The annexed statements contain useful information regarding the imports and exports of South Canara by sea. The total value of the imports has been steadily increasing during the last five years, the value of the articles imported in 1893-94 being estimated at 64 lakhs of rupees. The value of the exports has also risen from 111 lakhs of rupees in 1889-90 to 146 lakhs in the last year of the series. Piece-goods, salt, cocoanuts, salted fish, grain, copper and kerosine oil constitute the chief articles of import. The trade in grain is increasing and the chief grains imported are horsegram and Bengal gram, which are received from the Bombay and Bengal Presidencies and from the adjoining district of Malabar. Salt and salted fish are imported from Bombay and Goa, and copper from the United Kingdom, from the Bombay Presidency and from British ports within the presidency. The chief exports are coffee, spices, rice, bricks and tiles, oils, salted fish and raw tobacco. The coffee exported from the district is the produce of Mysore and Coorg and is shipped to the United Kingdom, Austria, France, Germany, Persia, Turkey, Arabia, Beloochistan, Ceylon, Bombay, Calcutta and Malabar. The trade in this article is increasing. The bricks and tiles exported from the district are manufactured locally and sent to Ceylon, Bombay, Aden and other places. The oil exported is chiefly sandalwood oil manufactured in the district, which finds a ready sale at Calcutta, Bombay and Madras.

CHAPTER IX.

AGRICULTURAL STATISTICS.

THE total area of the district is 2,497,280 acres, and this is composed CHAP. IX. of 2,485,162 acres of Government land and 12,118 acres of Minor The Land. inams. The district does not contain any Whole inam or Zemindári villages.

Of the total extent of Government land, 1,832,396 acres, or Extent per 73.73 per cent., are not available for cultivation. About threefifths of this area (1,173,953 acres) is forest, and the remainder consists of land which is either unfit for cultivation or is occupied by roads, streams, village sites and the like. The area available for cultivation is thus 652,766 acres, and of this extent 426,022 acres are occupied and 226,744 acres are still available for the extension of cultivation. The total extent of arable land in Government villages is 663,711 acres. The population of these villages is 1,052,359, so that there is 0.63 of an acre of culturable land per head of population, but the extent actually cultivated is only 0.36 of an acre. In this calculation, however, the area cropped more than once has not been taken into account. If allowance be made for this, the proportion of cultivated land to each inhabitant is 0.55 of an acre. It is not possible to ascertain the extent of uncultivated land which is capable of yielding more than one crop, but it may be assumed that this is very small, as it is highly improbable that a large extent of such valuable land would be left uncultivated altogether. Omitting this, and taking into consideration only the land actually cropped more than once, the extent of culturable land to each inhabitant is 0.81 of an acre. There is still considerable room for the expansion of cultivation for at the end of the year 1892-93 there were 227,000 acres of culturable land available for the purpose. Of course, these lands are for the most part of inferior quality and the cultivator who wishes to bring them under the plough would have to incur a considerable initial outlay.

The subjoined statement is useful as illustrating the extent of the pressure of the population on the land in each taluk.

Mangalore	•••	•••	278,908	0.69	0.37	0.92	0.60
Udipi		•••	253,717	0.52	0.32	0.70	0.50
Uppinangadi		•••	118,807	0.90	0.49	1.19	0.78
	TOTAL		1,052,359	0.63	0.36	0.81	0.55

[#] Exclusive of the extent cropped more than once.
† Inclusive of the extent cropped more than once.

In Coondapoor, Kásaragód and Udipi the area of cultivated land per inhabitant (including the area cropped more than once) does not differ much from the district average. The pressure is greatest in Kásaragód and least in Uppinangadi and the difference indicates roughly the different degrees of fertility of the soil in two tracts.

The foregoing statistics of cultivation relate to the year 1892-93 which appears to have been very favourable for agricultural operations. If we take the figures for the five years ending with 1892-93 we find that the average annual extent of cultivation was 379,134 acres, excluding the area cropped more than once, or 573,265 acres if that area be included. The extent of land actually cultivated by each individual thus comes to 0.36 and 0.54 of an acre respectively, according as we exclude or include the area cropped more than once. Half an acre per head of population including second crop may be taken as the ordinary proportion.

The size of farms.

The number of pattás is in round numbers 45,500 which gives an average extent per pattá of 9.6 acres. The average area per pattá is not necessarily the same thing as the average size of a ryot's farm, for a man may hold several pattás; and on the other hand, one pattá may cover the holding of a large joint family, consisting of several households, in the usual sense of the term. It is not, therefore, possible to deduce from these figures the actual

age of the

number of ryots. But whatever the exact figure may be, it is clear that the ordinary holding is small, and this fact is well brought out by the rent-roll statistics given below:

CHAP. IX. The size of farms.

Statement showing the Rent-roll of South Canara for fasli 1302.

				Single pattás.	Joint pattás.	Number of registered holders of joint pattas.
Pattás	s under Rs	s. 10		21,347	I	3
Do.	·between	Rs. 10 and Rs. 30		10,994	1	2
Do.))	Rs. 30 and Rs. 50		5,584	• •••	
Do.	,,	Rs. 50 and Rs. 100		4,901		
Do.	2)	Rs. 100 and Rs. 250		2,212	•••	
Do.	"	Rs. 250 and Rs. 500		377	•••	
Do.	"	Rs. 500 and Rs. 1,000		98	•••	
Do.	above Rs	s. 1,000	•••	21		
	Tota	L NUMBER OF PATTAS	•••	45,534	2	5

It will be seen that nearly one-half of the ryots pay assessments below Rs. 10, and the extent of the property cultivated or owned by them must therefore be very small indeed. The average amount paid by each of the pattadars who pay less than Rs. 10 is Rs. 3-6-1, which is about the mean district assessment of an agre of land. The proportion of ryots who pay assessments below Rs. 30 is two-thirds, while more than three-fourths pay less than Rs. 50. The majority of the ryots who pay assessments over Rs. 250 live in the Udipi and Coondapoor taluks. In the Uppinangadi taluk the highest assessment paid by any single individual is only Rs. 565 and in this taluk the average assessment per pattá amounted to Rs. 30 in fasli 1302. This is slightly less than the average for the district as a whole. In the Kasaragod taluk the average is about Rs. 18 and this low proportion is due to the fact that 90 per cent. of the ryots pay assessments below Rs. 50.

The annexed statement shows for each of the six years ending Crops. 31st March 1893 the acreage under each kind of crop grown on ryotwari and minor inam lands. In the case of lands cropped more than once in a year their extent is taken to account for each crop. The area cropped will therefore exceed the area shown as cultivated.

CHAP. IX.
THE LAND.
Crops.

Rice is by far the largest crop, about four-fifths of the cultivated area being under it. Next comes the cocoanut palm, which occupies an extent of nearly 25,000 acres. This palm is a favourite object of cultivation among the inhabitants of South Canara and of the adjoining district of Malabar and numbers of trees can be seen in front of almost every house. The dry grains including the pulses, occupy the next place; the only one which is grown to any considerable extent is ragi and the average area under this crop during the last six years was only 3,289 acres. The acreage under pulses varies from 41,150 acres in 1889–90 to 35,803 acres in 1891–92.

Of special crops the most important are pepper and the arecanut, the normal acreage under them being about 4,000 and 9,500 acres respectively. The area under arecanuts has fallen slightly, viz., from 9,818 acres in 1887–88 to 9,257 acres in the last year of the series.

CHAP. IX.
THE LAND...
Crops.

CHAP. IX.
· LAND
· REVENUE.

The total land revenue of the district is in ordinary years slightly under 13 lakhs of rupees. The whole of this amount is derived from ryotwari villages, there being as already stated neither whole inam nor zemindari villages in the district. The following table shows the land revenue demand for a series of fifteen years:—

Fas. year		Land revenue.	Fasli year.	Land revenue.	Fasli year.	Land revenue.
		RS.	1	RS.	 • • •	RS.
1288		12,88,140	1293	12,90,901	1298	12,79,310
1289		12,60,128	1294	12,80,278	1299	12,84,506
1290		12,69,245	1295	12,80,731	1300	12,85,163
1291		12,76,681	1296	12,81,298	1301	12,96,100
1292		12,78,309	1297	12,90,317	1302	13,38,258
Averag	æ	12,74,501	AVERAGE	12,84,705	Average.	12,96,667

It will be seen that the average during the last three quinquennia has been slowly increasing, the annual average for the latest quinquennium being about Rs. 22,000 greater than the annual mean of faslis 1288-92.

Collection of the revenue.

The above figures do not include the cesses levied on land for various purposes. These amount to Rs. 1,60,000 per annum, and in the statement showing the collection of revenue no distinction is made between them and the land revenue on which they are assessed and with which they are collected. The total demand including the cesses comes to about 14\frac{3}{2} lakhs of rupees a year; the subjoined statement gives the gross demand and collections for each of the last five years:—

Land Revenue Demand and Collections.

P	Pasli :	year.		Demand.	Collected within the year.	Balance.	Arrears collected.
				Rs.	RS.	RS.	RS.
1298		•••		14,31,997	14,26,654*	5,343	5,164
1299	•••	•••		14,37,370	14,32,430	4,940	5,105
1300	***	***		14,38,370	14,34,870	3,500.	5,005
1301	•••	•••	•••	14,71,875	14,68,967	2,408	3,462
1302	***	•••	•••	15,13,719	15,09,924	2(795	2,313

Both the demand and the collections show a steady increase.

Number of cases in which property was Fasli year. Distrained. Sold. 1297 230 65 1298 138 80 1299 49 250 1300 303 ... 1301 322

The proportion of the revenue collected within the year is very high, and it is satisfactory to note that the revenue has been realized without any great pressure on the ryots. The marginal statement gives the number of cases in which property was distrained and the number of those in which property was actually sold.

LAND REVENUE.

Collection of the revenue.

The number of pattás is about 45,000, so that there was on an average only one sale for every 724 pattás.

The following statement shows the amount of occasional remis- Remissions. sions granted during each of the past ten years:—

					46 1.00 M.S. 1. S. S. S.	Remission	
	Fasli 3	70 ar.			For waste.	For failure of crop.	Total.

The assessment remitted on account of failure of crop is distinguished from that remitted on lands which were left waste or uncultivated, owing to circumstances beyond the occupant's control. The average amount remitted comes to Rs. 10,382 per annum which is about seven-tenths per cent. of the gross demand and in no year were the remissions at all large. South Canara enjoys, indeed, an enviable exemption from bad seasons. More than three-fourths of the remissions for waste are granted in Uppinangadi, while Udipi has the largest share of the remission on account of failure of crop. In addition to these there are certain other

CHAP. IX. LAND REVENUE.

Remissions.

remissions which consist chiefly of deductions from the settlement assessment on account of waste salt pans, &c., of payments direct from the revenue towards the Village Service Fund and of the amounts disbursed to inamdars in lieu of their inams which have been resumed by Government. The contributions to the Village Service Fund amount to Rs. 33,975 per annum and the payments for resumed inams to about Rs. 74,000 a year.

Taluk revenue. The land revenue demand of each taluk for fasli 1301 is given below and the figures for this year represent approximately the average annual demand.

The total number of tilling and draught cattle is 350,000 or a pair to every 3:60 acres of occupied land in 1892-93. The proportional extent varies from 4.28 acres in Mangalore to 2.99 acres in Udipi. There are on an average 18 cows and cow-buffaloes to Live-stock, every 100 inhabitants, and here also the statistics for each taluk exhibit considerable variations. In Uppinangadi there are 25 cows and cow-buffaloes to every hundred of the population, in Coondapoor and Udipi the ratios are 22 and 20 respectively, while Mangalore has only 14. The total number of sheep and goats in the district is only 10,807, which gives about 17 of these animals to every 1,000 acres of occupied land. The number varies from 31 in Kásaragód taluk to 9 in Coondapoor.

CHAP. IX. AGRICULTU-RAL STOCK.

As regards dead-stock, there is one plough to every 2:40 acres Dead-stock. and one cart to every 1451 acres in occupation. The proportions in the taluks vary in the former case from 1.91 acres to a plough in Udipi to 3.05 acres in Uppinangadi, and in the latter from 208-30 acres to a cart in Kásaragód taluk to 84-83 acres per cart in Udipi.

The marginal statement shows the mortality among stock Cattle

during the last five years, and further details are given in the statement appended to this chapter. These figures do not include the deaths from natural decay as the registration of the mortality from this cause is very imperfect. The chief diseases are rinderpest and anthrax. A very large number of cattle are annually killed by wild animals. and the number of deaths from

snake-bites, on an average, 36 per annum. The reported deaths from wild animals are far higher in Canara than in any other district of the presidency. Rewards are granted by Government for the destruction of those animals which are dangerous to human or cattle life. The subjoined table shows the number of animals killed and the rewards granted for their destruction during the past No rewards are given for the destruction of snakes.

Mortality.

CHAPTER X.

IRRIGATION.

CHAP. X. There are no Government works of irrigation in the district. The cultivation is mainly dependant on the falling rains, although for the cultivation of the second and third crops water is obtained in some localities from rainfed tanks situated near the fields and from rivulets and rivers by the construction of temporary dams at the private expense of the cultivators. Small anicuts of this kind are found in abundance all over the district, though perhaps there are more in the Uppinangadi taluk and fewer in Kásaragód than elsewhere. Where water for irrigation cannot be obtained by direct flow, it is raised by a variety of primitive contrivances according to the depth from which it has to be procured. A description of the various appliances in use will be found in the first volume of this manual.

CHAPTER XI.

FORESTS.

An account of the early history of forest conservancy in South Canara is given in chapter I of the first volume of this manual. The subjoined statement shows the extent of forest land in each Conservation. taluk in 1893:—

CHAP. XI. Forests.

Taluk.		•		served rests.		served ands.	Total.		
			No.	Extent.	No.	Extent.	No.	Extent.	
				ACS.		ACS.		ACS.

Uppinangadi		•••	2	25,600	734	305,797	736	331,397	
	TOTAL .	.,,	23	63,939	981	590,444	1,004	654,383	

On the 30th June 1893 there were 63,939 acres of reserved forests and 590.444 acres of reserved lands. Most, if not all, of the latter will eventually become reserved forest. Uppinangadi has the largest extent of forest land, and in both Coondapoor and Udipi there are over 100,000 acres. Taking the district as a whole, there are 1,022:47 square miles, or about 26 per cent. of the total area, under the control of the forest department. an extent of 0.62 acres of forest land to each inhabitant.

The receipts and charges of the department for the last five

years are shown in the margin.

Year.	Receipts.	Expen- diture.
	RS.	Rs.
1888-89	79,065	63,370
1889-90	49,834	52,176
1890-91	56,208	49,594
189192	48,246	50,174
April 1892- June 1893.	76,788	61,723
TOTAL	3,10,091	2,77,087

The average annual surplus amounted to Rs. 6,611. The figures exhibit considerable variations both in receipts and expenditure and in 1889-90 and 1891-92 the expenditure exceeded the receipts by about two thousand rupees in each year. These variations are, in the main, due to the

Revenue and expenditure.

1892-93

CHAP. XI. FORESTS.

fact that forest conservation, in an extensive scale and in a systematic manner, is still in its infancy and a regular scheme of work has hardly yet been adopted.

tablish. ent.

The permanent establishment of the department consists of one district forest officer, three rangers, five foresters, and 45 forest guards, besides a number of clerks, attenders and peons. addition to these, a small temporary establishment is employed annually to watch the forests.

est nces.

The number of offences against the forest laws has increased from 205 in 1888-89 to 831 in Number 1892–93. The majority of the Year. of offences are cases of unauthorized offences. 1888-89 205 felling of trees in reserved forests. 411 1889--90 1890-91 262 1891-92 403

The increase in the number of offences is more apparent real and is due to the greater care

bestowed on the conservation of forests and bringing offences to A large proportion of the offences are compounded for a money payment by the offenders.

CHAPTER XII.

SALT AND ABKÁRI REVENUE.

THERE are no salt factories in South Canara and the salt re- CHAP. XII. guired for consumption is obtained from Bombay. The inhabitants prefer the Bombay salt to the Madras article, as the former is both cheaper and lighter than the latter. Steps are being taken to ascertain whether it is not possible to produce light salt without loss of chemical purity, and if the attempt proves successful, the Madras salt should soon get into favour with the inhabitants. The quantity of salt imported from Bombay in 1892-93 was 316,478 maunds. The quantity imported in the three preceding years is

Year. Quantity. I. MDS. 1891-92 322,514 1890-91 326,859 1889-90 331,155 shown in the margin, and it will be seen that the imports have been slowly but steadily going down. The whole of the salt imported is not consumed in Canara. The provinces of Mysore and Coorg receive annually a supply of this article from the

district, but the exact quantity is not known, as the registration of road traffic with those provinces has been discontinued from 1st April 1889. If we treat Mysore and Coorg and the two West Coast districts as one group, the average quantity of consumption per head comes to 13:06 lbs.; for the presidency the average is 16:39 lbs. The average price of salt in the district during the year 1892-93 was 11·12 seers (of 80 tolas) per rupee, the average for the adjoining district of Malabar being 11.05 seers a rupee.

There are nine fish-curing yards in the district where salt is supplied free of duty for pickling fish. Of these the most important are those at Ullal and Deriabahadurgur (Malpé). The total quantity of fish cured annually is, however, only about 30,000 or 40,000 maunds, a quantity which is insignificant compared with the 400,000 maunds of the adjoining district of Malabar.

The manufacture and sale of intoxicating liquors and drugs are regulated by law and their consumption is limited by the imposition of a tax. The revenue derived from this source is called 'abkári' revenue.

SALT.

CHAP. XII.

Present systems— Arrack.

The mode of administration now in force is, as regards arrack or country spirits, the renting system. Under this system the exclusive privilege of manufacture is disposed of by auction. The number of stills is limited as far as possible; the strengths at which liquor may be sold are restricted to 20°, 30° and 60° under proof, and minimum prices are fixed. A special scheme was introduced from 1st October 1891 as a step towards concentration of manufacture. The rural parts of the district were divided into manufacturing and non-manufacturing areas, the renters of the former having the privilege of manufacture and sale in respect of their own farms as well as the privilege of supplying spirits to the non-manufacturing areas at the rate of Rs. 1-12-0 per gallon of 30° under proof. The vend area renters had the privilege of sale only in their own areas. Renters of each class made their own arrangements with shop-keepers, whom they were obliged, however, to supply at Rs. 2-4-0 per gallon of 30° under proof. From 1st October 1892, the privileges of manufacture and sale were separated, the number of manufacturing areas was reduced from 26 to 17, and the vend areas were abolished, the shops being sold separately. The renters of the manufacturing areas were given the privilege of manufacture only, each of them supplying a certain number of independent shops at the fixed rate of Rs. 2 per gallon of 30° under proof. Eleven of the areas were allowed one sub-still each for the manufacture of weak liquor to be transported to the main still for redistillation. Issues to shop-keepers from the sub-distilleries were forbidden, and the liquor was allowed to be removed only in the presence of an Abkari officer. For the convenience of the shop-keepers certain distillers were required to keep depôts to which liquor was consigned from the stills for issue to shops. There were in all twelve such depôts. The privilege of manufacture in the tree-tax areas of the district was subject to the payment of tree-tax upon the trees from which the toddy required for distillation was drawn, while in the rest of the district, part of the tax was collected in the form of a license fee imposed on each toddy-drawer.

The Mangalore town is under the contract distillery supply system. The exclusive privilege of manufacture and supply of country spirits in the town is disposed of by tender, while the shops are sold separately. The contractor is bound to obtain the toddy required for distillation from marked trees on which the tree-tax has been paid, and is bound to supply shop-keepers at a fixed rate per gallon, which is termed the still-head charge, and the exclusive privilege of manufacture and supply is granted to the approved tenderer who offers to Government the largest share of such still-head charge in the form of duty. The last contract,

which expired on the 30th September 1893, gave Government CHAP. XII. a revenue of Re. 1 as still-head duty on every gallon of 30° under proof manufactured by the contractor. The selling price of a gallon of this strength was fixed at Rs. 2-8-0.

The tree-tax system is in force throughout the whole district. Toddy. The system consists in the charge of a yearly or half-yearly tax per palm tree to tap trees for fermented toddy. Such licenses are issued on the application of licensed distillers of arrack, of toddy shop-keepers, of toddy-drawers and of tree owners, for the drawing of toddy required for domestic consumption but not for sale. licensees make their own arrangements for procuring trees. fees charged for the several kinds of palm trees tapped in the tree-tax areas are shown below :--

Kind of tree.	Rate of tree-tax per tree.	For what period.
	RS. A. P.	
Cocoanut palms	0 12 0	For each half year.
Sago palms	1 8 0	S for each nam year.
Palmyra or date palms	0 12 0	For the whole year.

The revenue from the sale of foreign liquor is derived from Poreign rentals, determined by auction, in the case of tavern licenses (i.e., licenses for the retail sale of foreign liquor to be consumed on the premises), and from fixed fees in the case of licenses for hotels, refreshment rooms, wholesale shops and shops where the liquor is not to be drunk on the premises. Country spirits excised at strength other than 20°, 30° or 60° under proof are treated as foreign spirits.

The monopoly of the retail sale of opium and of the manufac- Opium. ture and sale of intoxicating drugs prepared from opium is sold by auction on the farming system, and the farmers either import the drug themselves or procure it from licensed importers. Licenses to import opium are granted by the Board of Revenue on the recommendation of Collectors. The license must be produced before the Deputy Opium Agent at Indore, who passes the opium on payment of the pass duty, and the consignments on arrival in the district are checked by some responsible revenue officer and are then passed on for sale to farmers and licensed vendors.

The possession and transport of intoxicating drugs prepared Hemp drugs. from the hemp plant are freely allowed, but only persons licensed by the Collector are permitted to sell them. The number of

CHAP. XII. Abkári. licenses to be issued in each district is fixed annually by the Board on the recommendation of the Collector, and the licenses as thus determined are then sold by auction.

Shops.

The number of arrack shops has fallen from 987 in 1888-89 to 741 in 1892-93. Each shop has now to supply an area of 5.3 square miles containing a population of 1420, the average for the presidency being an area of 10.2 square miles and a population of 2,866. The number of toddy shops was 2,261 in 1888-89, but it had fallen to 939 in 1892-93. The area to each shop is 4.2 square miles, the average for the presidency being 6.5, and the mean population is 1,121 which is 709 less than the provincial average. The number of shops for the sale of opium and intoxicating drugs has remained stationary, and is now only four.

Consumption.

The statistics of consumption are imperfect, as no record is kept of the quantity of toddy drunk, and in South Canara toddy is the favourite beverage among the lower classes. Of arrack the annual consumption during the last five years is shown in the annexed statements. The average consumption per head of population is in ordinary years about 12 of a gallon of spirit of proof strength. A higher proportion is found in only three districts, viz., Godávari, Kistna and Nilgiris. The consumption is much greater in the Mangalore town than in the rural tracts of South Canara, the average quantity per head amounting to nearly a third of a gallon in the former. The statistics show that the inhabitants of Udipi and Uppinangadi are more devoted to Baachus than their brethren in other taluks. The quantity of opium and its preparations sold in the five years ending with 1892-93 comes to about 137 lbs. per annum or .005 of a tola per head of the population. There are no statistics of the consumption of intoxicating drugs, but the amount is known to be very small.

Revenue.

The total abkári revenue of the district is about 34 lakhs per annum, of which one lakh is derived from arrack, Rs. 2,21,000 from toddy, Rs. 900 from foreign spirits, Rs. 2,000 from opium and the rest from various miscellaneous sources. In 1888-89 the total revenue was Rs. 2,27,000, and in 1892-93 it rose to Rs. 3,27,000. In the case of arrack revenue the increase during this period was 8.87 per cent., while the increase in consumption was as high as 45.40 per cent. The large increase in consumption is reported to be due to the revival of the renting system in the rural parts of the Mangalore taluk from 1st October 1890, and to the preference of the consumers for toddy-arrack which was available throughout the year. The incidence of arrack revenue is about an anna and a half per head, while that of toddy is 3

annas and 4 pies, or a total of 4 annas and 10 pies against an CHAP. XII. average for the presidency of 4 annas and 11 pies. The retail price of liquor varies a good deal, but it is probably not more than Revenue. 25 per cent. of the tax, so that the 'drink bill' of the district comes to nearly 6 annas per head per annum. This contrasts very favourably with the expenditure on intoxicating liquors in the United Kingdom which amounted in 1893 to £3-12-3 per head of the population.

CHAPTER XIII.

INCOME TAX AND STAMP REVENUE.

THE marginal table shows the revenue from the tax on incomes for CHAP. XIII.

Year.	Number of persons assessed.	Total assessment.
		RS.
1888-89	1,301	30.896
1889-90	1,407	34,436
1890-91	1,395	33,574
1891-92	1,435	33,199
1892-93	1,605	37.939

each of the last five years. In INCOME-TAX. 1888-89 there were 1,301 per- Amount of sons assessed to the tax and the tax. amount realized from it was Rs. 30.896. In the following year the number of assesses rose to 1,407, and the amount of the tax advanced by about Rs. 3.500. The final demand in the last year of the series was Rs. 37,939 and the number of persons

assessed in that year was 1,605. A considerable proportion of this advance is probably due to greater care in assessment and not to increased prosperity.

Of the different classes of people assessed to the tax, the most Classes important are the money-lenders and changers, of whom 375 paid assessed. the tax in 1892-93, the amount collected being Rs. 6,654. The number of money-lenders shown in the census tables is only 246, and this figure includes not only those who actually exercise the occupation, but also those that are dependent on it for their livelihood. It is clear that the census returns were defective as regards this occupation, and the error is mainly due to the fact that moneylending is frequently combined with other occupations. Of the remaining classes of assessees, the most numerous are Government employés (218) and servants of local bodies and companies (146). Only one company (the Basel Mission Company at Mangalore) was assessed in 1892–93.

The total number of assessees in 1892-93 was 1,605 which gives Incidence of one assessee in every 658 of the district population, the ratio for the the tax. presidency, exclusive of the capital town, being 1 in 577. The incidence of the tax was 6.8 pies per head of the population, against 8.2 pies for the presidency outside Madras. If the incidence of income-tax can be taken as a measure of the wealth of a district, then only eight out of the 21 districts are poorer than South Canara.

CHAP. XIII.
INCOME-TAX.
Incidence of the tax.

In the neighbouring district of Malabar the incidence is 6.7 pies per head. If we take only the actual number of assessees, the amount per head comes to Rs. 23-10-2, the average of all districts being Rs. 24-14-7.

Taking only the tax on the general population, i.e., excluding incomes of companies, servants of Government, servants of local bodies and companies, and incomes derived from public securities, the incidence of the tax is 4.9 pies per head. The incidence varies a good deal in different taluks as shown below:—

Taluk			Inc per pop	hea	d of	Inci- per h asse		of	
Coondapoor					Р. 3·5	RS. 15	A. 5		
Kásaragód			0	0	3.1	16	14	8	
Mangalore	•••		0	0	9.8	31	8	4	
Udipi		•••	0	0	3.6	15	1	6	
Uppinangadi			0	0	1.2	15	9	1	
	TOTAL	•••	0	0	4.9	21	8	7	

The high rate of incidence in the Mangalore taluk is, of course, due to the trade in the capital town of the district. The rate in Uppinangadi is much lower than in any other taluk, and this part of the district is undoubtedly the poorest.

Of the total number (1,240) of persons assessed under Part IV of the schedule, 751, or 60.56 per cent., have incomes below Rs. 750, while 948 have an annual income of less than Rs. 1,000. There are thus only 292 persons, or 23.55, per cent., who have assessable incomes over Rs. 1,000, and of these again all but 90 have less than Rs. 2,000 a year. There are 72 persons with incomes between Rs. 2,000 and Rs. 5,000, twelve with incomes ranging between Rs. 5,000 and Rs. 10,000, four with from Rs. 10,000 to Rs. 20,000, one with an annual income of between Rs. 30,000 and Rs. 40,000 and another with between Rs. 40,000 and Rs. 50,000 a year. In other words, 76.45 per cent. of the assessees have taxable incomes under a thousand rupees a year. 16.29 per cent. between one and two thousand rupees, 5.81 per cent. between two thousand and five thousand rupees, 0.97 per cent. between five thousand and ten thousand rupees, and 0.48 per cent. ten thousand rupees and over. These figures indicate the absence of great personal wealth in the district and the same feature is observed throughout Southern India. It is true that incomes derived from agriculture are not taxable, but even if these were included, the number of persons possessing large incomes would CHAP. XIII. not be appreciably increased.

INCOME-TAX.

Very little difficulty is experienced in collecting the tax. In Collection of 1892-93 as many as 521 persons failed to pay the tax within the the tax. time allowed, but only three defaulters neglected to pay after receipt of a formal notice of demand, and in none of the last five years did the number of defaulters at this stage exceed four, while the highest amount of the arrears was about Rs. 90. The number of cases in which property was sold was only one in each of the years 1889-90 and 1892-93, while in the other three years there was no necessity for resorting to this extreme measure. There was no special establishment for the assessment and collection of the tax in 1892-93, but a sum of Rs. 60 was paid in that year as commission to companies for collecting the tax payable by their servants. The expenditure is only 0.16 per cent. of the assessment.

The statistics of stamp revenue are compiled for periods of three

years and the marginal statement gives the figures for the three most recent periods. The receipts from this source rose from Rs. 6,24,741 in the first period to Rs. 6,43,568 in the years 1890-93. The average annual receipts during the last three years amounted to Rs. 2,14,523. Of this sum Rs. 1,44,750 is derived from the sale of judicial, and Rs. 68,459 from

Period. Revenue. RS. 1884-87 6,24,741 1887-90 6,14,709 1890-93 6,43,568

non-judicial stamps; the small balance consists of miscellaneous items.

The annexed statement, which has been furnished by the Superintendent of Stamps, shows the number and value of the different kinds of stamps sold in the district during each of the last three years. Court-fee adhesive stamps constitute nearly onehalf the total number of stamps sold; impressed stamped papers, used for certified copies of public records, form a little over onefourth, while the proportion of non-judicial stamped papers is about 13 per cent. As regards value, a large portion of the receipts is derived from the sale of Court-fee adhesive stamps and non-judicial stamped papers. The incidence of the average stamp revenue for the last three years per head was 3.25 annas and only in Tanjore, Malabar and Tinnevelly is the incidence higher than this. There is thus no connection between the incidence of stampduty and that of income-tax. The number of licensed stamp vendors in the district in 1892-93 was 49, or one to every 21,553 of the population and to every 80 square miles of area.

CHAPTER XIV.

SPECIAL FUNDS AND ENDOWMENTS.

Prior to the passing of the Village Cess Act (IV of 1864), the CHAP, XIV. village officers in the Police and Revenue departments were being remunerated in money and kind. The collection of such fees by the officers entitled to them was often difficult and objectionable, and the Government, therefore, thought it expedient to abolish them and substitute a money-cess in lieu thereof. The Village Cess Act was accordingly passed and all holders of land in the district to which this Act was applied were liable to a money-cess levied at a certain percentage of the assessment and the proceeds of the cess were devoted to the payment of village servants employed on Revenue and Police duties within the villages in which the cess was imposed.

The necessity for re-organizing the village establishments in the district was urged from time to time, but it was not till 1882 that definite proposals were submitted to Government for the purpose. These proposals were approved by Government, and the Village Cess Act was introduced from fasli 1292.

The above Act has since been repealed by Act IV of 1893. Under the latter a cess based on the land assessment and watertax payable to Government is substituted for the fees in money or kind which were formerly paid. The rate of cess is to be such as will yield a sum as nearly as possible equivalent to one-half of the cost of the village service within the area to which the Act is applied, but it shall not in any case exceed one anna in every rupee of land assessment and water-tax. The other half of the cost of the village establishments is defrayed by contributions from general revenues. These contributions consist principally of the proceeds of lands formerly appropriated to the remuneration of village servants but since resumed by the Government.

As a preliminary to the introduction of the old Village Cess Revision of Act of 1864 the village establishments were, as already stated, village establishments.

VILLAGE SERVICE

FUND.

Its origin.

CHAP. XIV.
VILLAGE
SERVICE
FUND.

Revision of village estab-

revised and the general principles on which the revision was based are, briefly, as follows.

The number of villages was left intact and one potél was generally allowed to each village; there were, however, several potéls who had more than one village for their respective charges, and in a few cases there were two potéls to a single village.

The pay of 60 potels in villages along the principal lines of road was raised, the pay of 33 of them being increased by Rs. 2 per mensem and that of 27 potels at the most important stages by Rs. 3 per mensem. An extra ugráni (village peon) was sanctioned for each of these 60 potéls, and to another potél whose village was likewise at one of the most important stages, but whose pay being sufficiently high did not call for an increase. The extra ugránis sanctioned for these potéls were to be exclusively employed in procuring supplies for Government officers and other travellers, while the ugráni given to them in common with other potéls in the district was to be utilized for the ordinary revenue work of the village. All those villages in which the annual assessment was below Rs. 1,000 a year were deprived of their ugránis, and the potél had to do his work unaided. The savings effected by this curtailment were utilized in giving an extra annual allowance of Rs. 12 to all the potels in the district.

Next as regards the shanbogs, or village accountants. Their number was raised by one as the charge of one of them was found to be too large for efficient management. Their pay was regulated on the principle that each should get Rs. 10 for every village in his tarf or circle and a half per cent. of the land revenue collections, subject to a minimum of Rs. 8 and a maximum of Rs. 10 per mensem, except in certain unhealthy máganés under the ghâts, where the minimum was raised to Rs. 9, the maximum being the same as elsewhere. In those villages, however, in which the pay of a shanbog, calculated on the above principle, fell short of his previous pay, the latter was retained, as it was thought undesirable that any one should be a loser by a re-organization, the aim of which was to improve the position of the village servants generally. An ugráni was allowed for each shánbóg and he was paid Rs. 3 per mensem like the potél's ugráni. The office of moniagár, of which there were four in the Coondapoor taluk, was abolished.

Receipts and charges of the Fund, The receipts and charges of the fund are shown in the subjoined statement:—

	1888-89.	1889–90.	1890-91.	1891–92.	1892-93

VILLAGE
SERVICE.
FUND.

Receipts and charges of the Fund.

The falling off in the receipts in 1889-90 is said to be the result of an order of the Board of Revenue under which a certain percentage of the gross collections on account of land revenue and cesses was to be credited to village cess instead of the actual collections on account of the latter item as had previously been the case. The expenditure is mainly made up of the salaries paid to village servants. The balance to the credit of the fund on the 31st March 1893 was only Rs. 8,952. The closing balance of 1888-89 was Rs. 20,035.

CANAL AND FERRY FUND.

Under the Canals and Ferry Act (I of 1870), tolls and license fees are collected on all canals, lines of navigation and ferries to which the provisions of the Act are declared by the local Government to be applicable. The amount thus collected is taken to the credit of the 'Canal and Ferry Fund.' Such fund, after payment of all salaries and other expenses incurred, is devoted to the construction, improvement, repair, maintenance and extension of the channels and ferries to which the provisions of the Act are applied and of such bridges, roads and approaches leading thereto, and being in the same district within which the rents, license fees, tolls and fines are collected, as the Government directs from time to time.

The transactions of the fund for the three years 1888-89 to 1890-91 are shown below:—

_	1888-89.	1889–90.	1890-91.
Balance at the beginning of the year. Receipts during the year	Rs.	Rs.	RS.
	2	14	4
	23,208	25,080	26,206

	23,196	25,090	26,207
Balance at the end of the year	14	4	3

CHAP. XIV.

POUND
FUND.

The increase in the receipts in 1889-90 is due to higher bids obtained for the lease of certain ferries sold in that year. The increased expenditure was caused partly by the payment of Rs. 1,000 to the Mangalore Municipality and partly by the larger outlay on boats. The transactions of the year 1890-91 closed with a balance of only Rs. 3 to the credit of the fund.

The only other special fund in the district is the Pound fund.

Year.	No. of pounds.
1888-89	820
1889-90	834
1890-91	837
1891-92	840
1892-93	841

The number of pounds has been slowly but steadily increasing as will be seen from the figures on the margin. There were 841 pounds at the end of the year 1892-93, or one pound to every 4.66 square miles, the average ratio for the presidency being one to every 14.14 square miles. All the pounds were

reported to be in good order; 828 were provided with both water-troughs and feeding-racks, 6 with feeding-racks only and 4 with water-troughs only; 447 were roofed structures and 394 were mere enclosures. All the pounds in South Canara are in good repair, while the proportion for the presidency as a whole in that satisfactory condition is only 78.57 per cent. Again, in South Canara 97½ per cent. of the pounds are provided with both water-troughs and feeding-racks, while for all districts taken together, the ratio is only 78.77 per cent. Lastly, while 53 per cent. of the pounds in

Year.	Receipts.	Expendi- ture.
	Nadasilay sida	1
	RS.	RS.
1888-89	1,963	2,019
1889-90	1,946	1,878
1890-91	2,176	2,138
1891-92	2,009	1,898
1892-93	2,274	2,278

South Canara are roofed structures, the proportion for the whole province is only 50.98 per cent. In 1888-89, the receipts from fees, sale of unclaimed animals, &c., amounted to Rs. 1,963 and the charges to Rs. 2,019. In 1892-93 they were respectively Rs. 2,274 and

Rs. 2,278. The balance at credit at the end of the year was Rs. 391, which is the smallest in the whole presidency. The balance on 1st April 1888 was Rs. 234.

ENDOWMENTS.

The annexed statement shows the various public endowments in the district. The endowments are all grants of money; there are no endowments in land.

Religious endowments. The religious institutions are (a) temples of Hindus, (b) maths (i.e., monasteries or residences of religious ascetics), (c) bhútastánams (shrines of demons), (d) masjids of the Muhammadans, (e) bastis (temples) of the Jains, and (f) Christian churches. The inams are paid partly under the béríz deduction system

from village collections and partly by way of assignments of land CHAP. XIV. revenue. The amounts falling under these two heads at the end Endowments. of the last fasli (1302) are—

> (1) Bériz deductions 69,700 11 (2) Assignments of land revenue. 37,759 TOTAL .. 1,07,459 15 8

The only endowed educational institution is that maintained Educational in connection with the mosque at Kásaragód which receives endowments. an annual allowance of Rs. 53 by way of assignment of land revenue.

The only class of endowed charitable institutions are those Charitable locally designated 'Aravattiges,' or water-pandals, at which endowments. drinking-water is supplied to wayfarers during the hot weather. These inams are paid in each direct from the Treasury under permanent pay orders issued by the Accountant-General with the sanction of Government. The total amount of inams of this class was Rs. 124-14-9 at the end of fasli 1302.

The 'Brahmádáya,' or 'Jári Brahmádáya' ináms as they Grants to are sometimes called, are grants to Bráhmans to perform religious Bráhmans. rites by living in the Agrahárams, &c. This class of inams is paid either by way of assignments of land revenue or under the bériz deduction system. The amount of these inams at the end of fasli 1302 was Rs. 12,437-4-9 as shown below:—

	RS. A. P.
(1) Assignment of land revenue	7,273 11 3
(2) Béríz deduction	5,163 9 6
이 얼마나 하는데 하는데 그 모든 사람들은 얼마를 가는데 하는데 하다.	2,437 4 9

There are no Government irrigation works in this district; Endowments but remissions of assessment on private lands have always been nance of irriallowed for the upkeep and repair of kattus or dams thrown by gation works. ryots across water-channels. The maintenance of most of the dams is said to cost more than the amount of remission enjoyed on that account. These inams are all paid by deduction from the bériz, except a sum of Rs. 1-3-2, which is paid under a permanent pay order. The amount of inams of this class was Rs. 8,109-5-7 at the end of fasli 1302.

CHAPTER XV.

THE ADMINISTRATION OF JUSTICE.

THE Civil Courts in the district are the District Court, the Subordi- CHAP. XV. nate Judge's Court at Mangalore and six District Munsifs' Courts. The jurisdictions of the Subordinate Judge and of the District Munsifs are as follows:-

CIVIL JUSTICE. Courts.

Names of Courts.	Names of revenue taluks comprised within the jurisdiction of each Court.
Sub-Court, Mangalore	Ordinary jurisdiction: the whole district. Small Cause jurisdiction: the whole of the Mangalore Munsifi, 21 máganés in the Kárkal Munsifi and 2 máganés in the Kásaragód Munsifi.
Mangalore Munsif	Five máganés of the revenue taluk of Kásaragód, and the revenue taluk of Mangalore, except— (a) the eastern portion consisting of 16 máganés, (b) the northern portion lying to the north of the Sashittal river, and (c) the village of Kallamundkúr in Murnád mágané.
Kásaragód do	The revenue taluk of Kásaragód except (a) the 5 máganés included in the Mangalore Munsifi and 4 others included in the Puttúr Munsifi, (b) 15 villages of the Vittal mágané, and (c) the Íshwaramangal division of the Nettanige mágané.
Udipi do	Nearly all the western portion of the revenue taluk of Udipi.
Coondapoor do	The whole of the revenue taluk of Coondapoor and a portion of the Udipi taluk.
Kárkal do	The northern portion of the Mangalore taluk lying to the north of the Sashittal river, and the village of Kallamundkur in Murnad magane; most of the eastern portion of the Mangalore taluk comprising 12 out of the 16 maganes excluded from the Mangalore Munsifi; a portion of the Udipi taluk; and the Mujur magane in the Uppinangadi taluk.
Puttår do	The whole of the Uppinangadi taluk except the Mujúr mágané included in the Kárkal Munsifi 4 máganés of the Mangalore taluk; and a por tion of the Kásaragód taluk.

CHAP. XV.

CIVIL
JUSTICE.

Courts.

Village Munsifs are empowered, under the Madras Village Courts Act of 1888, to try petty suits in which the value of the property involved does not exceed Rs. 20; formerly the pecuniary limit was Rs. 10.

The Collector and his Divisional officers exercise civil powers under Regulation VI of 1831 and the Rent Recovery Act of 1865.

Suits.

The subjoined statement shows the number of civil suits instituted in each of the last five years:

There is less tendency to litigation in South Canara than in the presidency as a whole. In the latter one suit is filed, on an average, for every 151 inhabitants, but in South Canara it is only one for every 186. The bulk of the suits are decided by the District Munsifs. As regards ordinary jurisdiction the average annual institutions are, for the District Court 8, for Sub-Judge's Court 45, for the Revenue Courts 26, for Village Courts 742 and for District Munsifs' Courts 2,245. Small cause work is done entirely by the Sub-Judge and the District Munsifs, the institutions being 346 and 2,277 per annum respectively.

The annexed statement gives the details of the value of these suits. The bulk of them are for money or movables. The value of the subject-matter in the great majority of the suits is less than Rs. 100, and there are extremely few in which it exceeds Rs, 500.

Statement showing the number and value of Suits instituted in the several Courts of South Canara District in the years 1888-92.

During the last five years there were on an average 433 re- CHAP XV. gular appeals and 72 miscellaneous appeals. The average annual disposals were 409 regular appeals and 74 of the others. At the end of 1887, there were 174 appeals pending and 206 at the end of Appeals. the following year; but at the close of 1892 the number was no less than 349. In 1892 the average duration of an uncontested appeal was 208 days and of a contested appeal 253 days; in 1888 the figures were 109 and 161 days respectively. The average annual number of appeals to the High Court is 10 for first and 74 for second appeals. There were 76 second appeals in 1892.

CIVIL JUSTICE.

The marginal statement shows that these courts more than pay Receipts and

their way, the average charges. annual surplus being nearly a quarter of a lakh of rupees. There are, however, certain items on the expenditure side, such as pensions, which are not included in the charges. Rather more than half the annual income is derived from institution fees, process fees amount

Year.	Receipts.	Charges.	Surplus.
	ħs.	RS.	Rs.
1888	1,26,968	1,06,803	20,165
1889	1,33,402	1,00,747	32,655
1890	1,33,095	1,09,048	24,047
1891	1,30,504	1,14,289	16,215
1892	1,37,321	.1,12,798	24,523
Average.	1,32,258	1,08,737	23,521

to between Rs. 36,000 and Rs. 38,000, and miscellaneous court fees give about Rs. 10,000. The charges are practically all for salaries.

The highest criminal court in the district now is that of the Sessions Judge, who holds a sessions once a month for the trial of grave charges, hears appeals from the decisions of magistrates of Criminal Courts. the first class and has certain powers of supervision in respect of all the subordinate criminal courts. The real work of supervision, however, vests in the District Magistrate, an office always held by the Collector. The revenue divisional officers are always magistrates of the first class and their criminal jurisdiction is co-extensive with their revenue sub-divisions. These are the sub-divisional magistrates of the Criminal Procedure Code. The bulk of the original criminal work is done by magistrates of the second or third class.

CRIMINAL JUSTICE.

The average number of cases instituted in criminal courts of Work of the all classes during each of the past five years is 3,961, and of this Courts. number 3,376 were instituted in the courts of the subordinate stipendiary magistrates, 384 before benches or special magistrates, 152 before magistrates of the first class, 21 before the District Magistrate and 28 were trials at the sessions.

CHAP. XV.

CRIMINAL

JUSTICE.

Work of the Courts.

The percentage of persons convicted among persons brought to

Class of court.	Percentage o
Court of Session	44'20
District Magistrate	. 21.05
Assistant Magistrates	. 29.45
Deputy Magistrates	. 82.55
Subordinate Magistrates	. 33.01
Benches	41.00
Special Magistrates	. 94.12

trial in each kind of court during the five years ending 1892 is shown in the marginal table. The cases that come before the benches and special magistrates are for the most part petty nuisance cases, and the percentage conviction is naturally

high. Of the regular courts, the Subordinate Magistrates, who try the bulk of the cases, show a low percentage of convictions. Taking all courts together 33.65 per cent. or one in three of the persons charged were convicted. For all the courts of the presidency outside Madras the percentage for the same period was 39.72.

Appeals.

The average annual number of appeals to first-class magistrates and to the Court of Session is only 121 and 17 respectively. The ratio of persons who actually appeal to those on whom appealable sentences were passed by the subordinate magistracy is 11.46 per cent. and the corresponding ratio in the case of first-class magistrates is 56.08 per cent. It is only natural that the latter ratio should be the higher, for the offences tried by such magistrates are more serious and the sentences of course more severe. For the presidency, as a whole, the ratio of actual to possible appellants was 46.98 per cent. in the case of persons convicted by first-class magistrates, and 10:10 per cent. in the case of those dealt with by sub-magistrates, so there is in South Canara a slightly greater tendency to appeal than is found in most districts. Of appellants from decisions of first-class magistrates 21.80 per cent. were wholly and 16.59 per cent. were partially successful; the corresponding figures for the whole presidency are 19.91 and 12.70 per cent. Putting it in another way, of persons on whom appealable sentences were passed by first-class magistrates, 12:17 per cent. succeeded in getting their convictions reversed and 9.26 per cent. got the sentence or order modified in some way; in the case of the remaining 78.57 per cent. the Magistrate's decision and sentence were not interfered with. For the presidency, as a whole, on the other hand, only 9.14 per cent. of the persons convicted were wholly and 5.83 per cent. partially successful. Turning next to the appellants from the decisions of sub-magistrates, 42.64 per cent, of those who actually appealed were wholly, and 9.51 per cent. partially, successful. Of those on whom appealable sentences were passed, 4.79 per cent. got the decision reversed and 1.07 per cent. obtained some modification of the sentence or order; the corresponding figures for the presidency are 3.33 and 0.88 per cent.

Receipts and charges. The average annual receipts of the criminal courts of South Canara during the five years 1888-92 amounted to Rs. 20,971.

Fines yielded Rs. 14,823 and court-fees Rs. 5,838. The average CHAP. XV. annual charges during the same period were Rs. 50,017, so that the net cost of the courts, excluding charges for pensions and other indirect items, is Rs. 29,046 a year.

The judicial work done by Village Magistrates is trifling. The Village average number of cases filed before them in each of the last five years is only 742, although the number of petty cases must be far larger than this. The number of village magistrates who actually try cases is only about 82 in any one year, so that each man disposes on an average of about nine cases.

The present police force consists of one Superintendent, whose head-quarters are at Mangalore, 10 inspectors, and 532 constables. Present There is one police officer to every 7.3 square miles and every force. 1,985 of the population; or if we take only the force employed on ordinary police duties, there is one to every 9.6 square miles and 2,595 inhabitants. The corresponding figures for the whole presidency are 8.4 square miles and 2,112 inhabitants. The total cost of the police amounted in 1892 to Rs. 1,01,189 or one anna and seven pies per head of the population of the district. All the constables are armed with batoms, 243 are provided with fire-arms and 295 with swords. All the officers and 404 of the 527 men can read and write.

POLICE.

The work of the police, as shown by the subjoined statistics of Work of detection, is good:

	Year.	Percen cases de		Percentage convicte those a	d among	Percen proper cove	ty re-
		South Canara.	Presi- dency.	South Canara.	Presi- dency.	South Canara.	Presi- dency.
1888		 40.3	31.3	13.8	27.8	34.2	18:9
1889		 35.2	32.6	15.0	28.5	29.6	21.8
1890		42.1	35.2	19.3	29.6	50.0	25.5
1891		30.1	32.9	. 18.8	30-3	34.8	21.3
1892		 34.2	35.5	19.2	30.2	25.7	22.7

The foregoing statistics relate to all cognizable offences under

	Percentage detected					
Crime.	South Canara.	Presi- dency.				
Murder	. 40.5	28.1				
Dacoity	. 100.0	30.9				
House-breaking	. 40.5	35.7				
Robbery	. 26.7	42.2				
Cattle theft	. 47.1	47.4				
Other theft	. 43.1	43.6				

the Penal Code except nuisances. The percentage of detection is high in some of the grave crimes, but the detection of robberies is poor. The total value of property lost through crime during the last five years amounted to Rs. 1,26,528,

of which property valued at Rs. 43,801 was recovered.

CHAP. XV. POLICE.

This gives an annual income of Rs. 16,545 to the criminal classes, but the value of property as reported to the police is probably exaggerated.

ORIME. Statistics. The subjoined statement shows the amount of crime occurring in the district in each of the five years ending with 1892:

		under the Code.	Offences under	
Year.	Grave crime.	Others.	special and local laws.	Total.
1888	476 421	1,641 1,487	985 1,777	3,102 3,685
1889 1890	362	1,344	2,218	3,924
1891 1892	374 409	1,453 1,295	2,662 3,004	4,489 4,708
AVERAGE	408	1,444	2,129	3,981

The amount of grave crime was appreciably less at the end than at the beginning of the quinquennium. The number of other offences under the Indian Penal Code also shows a considerable decrease, while the offences under special and local laws, i.e., chiefly breaches of the excise, forest and municipal laws, have more than trebled during the last five years. The ratio of crime to population is lower in South Canara than in the presidency generally. Taking all cases together, there was in South Canara one offence per annum to every 265 inhabitants, while for the presidency the ratio is 1 to 155. For grave crime alone, the ratios are 1 to 2,588 for South Canara and 1 to 1,754 inhabitants for the presidency; for other offences under the Penal Code it was 1 to 731 for South Canara against 1 to 441 for all districts together; and for offences under special and local laws 1 to 496 in South Canara and 1 to 277 in the whole province.

Grave crime.

Statistics of the more important crimes are given below:

Crime.	1888.	1889.	1890.	1891.	1892.
Murder	11	10	4	11	6
Dacoity Robbery	* 5	6	4		6
House-breaking	86 13	58 10	75 13	71 23	90 11
Theft Ordinary	195	191	259	236	254

The figures vary so much from year to year that no useful inferences can be drawn from them.

The average annual number of suicides and accidental deaths CHAP. XV.

Number of suicides and accidental deaths, 1888-92.

Cause of death.	Total.	Males.	Females.
Suicide	348	203	145
Drowning	1,208	647	561
Wild beasts	18	17	1
Snakes	322	211	111
Other causes	540	459	81
TOTAL	2,436	1,537	899

during the last five years was 487; of Suicides and these 307 were males accidental and 180 were females. This gives a proportion of one death to every 2,169 inhabitants, the ratio for the presidency as a whole being 1 to 3,142. Some of the suicides

CRIME. deaths.

are ascribed to the state of mind produced by severe pain, others to ill-treatment at the hands of their relatives, and others again are due to quite trivial causes. In 1892 a lad aged 14 years hanged himself because he was rebuked for not properly reciting the Védas. Drowning is the favourite method of suicide with females, nearly 50 per cent. having adopted this mode of terminating their life. Hanging is also largely resorted to, for about a third of the total number of suicides are effected in this way. In the case of males, 79 per cent. of the deaths were due to hanging, while 15 per cent. drowned themselves.

As the manufacture, sale and possession of arms and ammuni- The Arms tion are controlled by the magistracy and the police, the subject will be noticed in this chapter. No native of India is permitted by law to possess arms without a license, but in numerous instances, the provisions of the law are neglected through ignorance. In South Canara, however, the Act has been diligently enforced during recent years with the result that the number of ordinary licenses to possess arms and ammunition and to go out armed has increased from 1,422 in 1888 to 1,800 in 1892. One person in every 319 of the population has a license, while for the presidency as a whole the ratio is only one in every 670. Registration is probably now fairly complete. The number of arms and ammunition shops was 54 in 1892, and of these 41 were licensed for manufacture as well as for sale. These shops are inspected once a quarter and the stock checked with the sale registers. In this way an effective control is exercised over the sale of gun-powder. sulphur and arms, and any unusual activity for the demand for them can be promptly investigated.

The prisons of the district consist of one district jail, and eight subsidiary jails for the confinement of under-trial and short-term prisoners. Prisoners sentenced to a longer term than one year are usually sent to Cannanore or one of the other large central prisons.

JAILS.

CHAP. XV.

JAILS.

District
jail.

The number of convicts in the district jail has steadily risen during the last five years and in 1892 the average daily strength was about 100. In 1888 it was only 62 90, but in 1880, on the other hand, it was 180 34. The total gross expenditure was Rs. 7,526 in 1892, but the convicts earned Rs. 261, so the net cost was Rs. 7,265. The average net cost to Government for the last five years was Rs. 6,990. During the same period, the average annual cost of a prisoner in the Mangalore district jail has always been higher than the average for all district jails in the presidency. In 1889 the cost was Rs. 109-12-0, but a great saving was effected in 1890 and the average cost per head in 1891 was only Rs. 72-10-0.

The vital statistics show that the death-rate fluctuates a good deal. The highest rate was 70.90 per mille in 1889, while the lowest was 30.95 in 1891. It cannot be concluded from these figures that the district jail is unhealthy, for the total number of prisoners confined in it is very small and the addition of even one or two to the number of deaths would considerably enhance the death-rate.

Subsidiary jails. It is only convicts whose sentences do not exceed one month who undergo their complete term in subsidiary jails; but persons under trial are largely confined in these prisons and other convicts, and even civil prisoners, are occasionally lodged in them temporarily while on their way to the larger jails. The average daily strength of the convicts in subsidiary jails was 8.99 in 1892, and the average number of under-trial prisoners confined therein was 9.27. The average annual expenditure on these jails is about Rs. 629. The cost per head during the past three years has been lower in South Canara than in the presidency as a whole. In 1892, the rate was Rs. 41-4-8 in South Canara as against Rs. 55-14-6 in the province as a whole. There are practically no earnings in subsidiary jails, as the prisoners are for the most part employed in keeping the jail premises clean.

CHAPTER XVI.

REGISTRATION.

Besides the office of the District Registrar at Mangalore, there are CHAP. XVI. 14 offices for the registration of assurances in South Canara. The places at which the Sub-Registrars' offices are situated are as follow:

Baindúr. Bantvál. Beltangadi. Brahmáwar. Coondapoor. Hosdrug. Kárkal. Kásaragód. Manjéshwar. Múdabidri.

Múlki. Udipi. Uppinangadi (Puttúr). Vittal.

Number of offices.

The total area of the district is 3,902 square miles, and there is thus one registration office to every 260 square miles, the average for the presidency as a whole being one to every 307 square miles.

The number of documents registered has risen from 16,562 in Documents 1888-89 to 19,215 in 1892-93. Of the latter figure 11.810 were registered. documents, of which registration was compulsory. Nearly 82 per cent. of the total number of documents relate to immovable property, and they are for the most part deeds of sale or mortgage.

The total value of the property concerned was 76 lakhs of rupees Value of in 1892-93. The value of immovable property sold was nearly property 11½ lakhs, which gives an average of Rs. 623 for each sale deed: the average for the presidency is Rs. 190. The total number of such documents was 1,824, and of these 445 were for sale of property valued at less than Rs. 100. The average value of such deeds was Rs. 42, while in the case of sales of property valued at Rs. 100 and above, the average value of each deed was Rs. 810. There were 5,234 mortgages of immovable property, the aggregate value being nearly 31 lakhs and the average value Rs. 589, the corresponding figure for the presidency being Rs. 188. The mortgage deeds of immovable property for less than Rs. 100 numbered 887 and the average value was Rs. 53, or rather more than the corresponding mean for sales. In the case of mortgages for Rs. 100 and upwards, however, the average value is Rs. 699, while the corresponding figure for sales is Rs. 810. The average value of all documents registered was Rs. 396; for the presidency the average was Rs. 203. Taking the total value of all registered transactions, the rate per head of the population is Rs. 7.20 against

AP. XVI. the presidency average of Rs. 5·16: all these averages tend to EGISTRA- show that South Canara is a comparatively wealthy district.

ancial.

The total receipts of the registration department in the district amounted to Rs. 40,700 in 1892-93, while the expenditure was Rs. 25,500. There was thus a profit of Rs. 15,200, but it must be remembered that there are many items of indirect expenditure not included in the charges. The average annual excess of income over expenditure during the past five years was Rs. 12,750.

CHAPTER XVII.

LOCAL GOVERNMENT.

MUNICI-PALITY.

CHAP XVII. THERE is only one town in the district which is under municipal. government. On the 31st March 1893, the municipal council was. at its sanctioned strength of 20 members, composed of 1 ex-officio, 4 nominated, and 15 elected. Of these only 8 were officials, while the rest were non-officials. There were 4 Europeans and 16 natives.

Finances.

The subjoined statement shows the receipts and charges of the municipality during the last five years :-

Year.	Income from taxation including tolls.	Income from other sources.	Total income.	Expendi- ture.
	Rs.	Rs.	Rs.	Rs.
1888-89	26,790	12,277	39,067	39,840
1889-90	25,675	12,162	37,837	37,120
1890-91	28,356	11,864	40,220	34,611
1891–92	28,733	15,086	43,819	42,002
1892–93	26,933	12,284	39,217	47,005
Total	1,36,487	63,673	2,00,160	2,00,578

The total expenditure during this period exceeded the receipts. but the difference does not exceed the opening balance. closing balance of 1892-93 was Rs. 4,811. A statement giving details of the receipts and charges for the last two years is appended-Similar statistics for previous years are not available, as the system of accounts then in force was different.

Taxation.

The principal taxes are those on buildings and lands, animals and vehicles, and professions and trades. Tolls also yield a considerable amount of revenue. The tax on buildings and lands is levied at $6\frac{1}{4}$ per cent. on the gross annual rental. The average assessment per house in 1892-93 was 2 rupees, the corresponding average for the presidency being rather more than Rs. 2-2-0. 1890-91 the incidence per house was as high as Rs. 2-6-10, but in the subsequent years it was hardly over Rs. 2 owing to the reduction of the rate at which the tax was levied from $7\frac{1}{2}$ to $6\frac{1}{4}$ per The average incidence of the tax on arts, trades and professions during the last five years was Rs. 7-14-7 ranging from Rs. 6-14-4 in 1888-89 to Rs. 9-2-2 in 1889-90. The high assessment in the latter year, however, was not realized, the actual collections amounting only to Rs. 6,333. Compared with 1889-90, the figures for 1890-91 show a large decrease both in the number of persons assessed and in the amount of tax. The decrease is ascribed by the chairman mainly to the branch bank at Mangalore and the Agents of the British India Steam Navigation Company CHAP. XVII. having secured exemption from tax under section 60 of the Act, and to the Basel mission having been, on appeal, allowed to pay one tax of Rs. 100 for the aggregate income accruing from all branches of industry under their supervision instead of being made to pay, as before, a separate tax on each branch of industry. For all taxation together, including tolls, the average incidence per head of population during the five years 1888-92 was As. 10-8. the average for all district municipalities being As. 11-11. If tolls be excluded the incidence per head comes to As. 5, while the average for the presidency was As. 8-7. The principal sources of income other than taxation are fees for the use of markets and slaughter-houses, school-fees, rent of lands; houses, &c., and grants and contributions from Government and Local Funds in aid of education, medical institutions, &c. The subjoined statement shows the average incidence during the last five years for the principal taxes and the total income; the corresponding figures for all district municipalities are added for comparison.

Statement showing the Average Incidence of Taxation during the years 1888-89 to 1892-93.

Municipality.	Incidence per house	Incidence per assessee	Incidence tant of all		Incidence per inha- bitant
municipanty.	of house tax.	of arts	Including tolls.	Excluding tolls.	of total income.
Mangalore All district municipalities	Rs. A. P. 2 1 5 2 0 9		Rs. A. P. 0 10 8	Rs. A. P. 0 5 0	0 15 8

The chief items of expenditure are public works (chiefly roads), Expenditure. conservancy, public instruction, hospitals and dispensaries and lighting. There is very little expenditure on water-supply or drainage, as there are no segular systems in the town. The existing watersupply is considered by the Deputy Sanitary Commissioner to be fairly good. The same officer remarks that better drainage arrangements are required in the crowded portions of the town, and it appears from the District Surgeon's report embodied in the report of the municipality for the year 1892-93 that arrangements for a preliminary survey have been made. Conservancy arrangements are reported to be fairly satisfactory. The town has 35 miles of road and 240 street lamps which gives an average of about 7 lamps per mile, the average for the presidency being a little over 8. There are 9 public latrines in the town or 1 to every 4,547 inhabitants: for the presidency, as a whole, the proportion is 1 to 1,531, and the latrine accommodation in Mangalore must be quite insufficient.

MUNICI-PALITY.
Statistics. CHAP, XVII.

Local Boards. Local affairs outside the Mangalore municipality are administered by the district board with the assistance of five taluk boards. The population (1891) of the district board's jurisdiction is 1,015,159. The board consists of a president (the Collector) and 24 members, one of whom is appointed vice-president. The 24 members consist of the three divisional officers, who are ex-officio members, 2 nominated members and 12 members who are elected by the taluk boards. The five taluk boards are Coondapoor, Kásaragód, Mangalore, Udipi and Uppinangadi, and their local area coincides with that of the five revenue divisions of the district. Each of the taluk boards has 12 members. No unions have been formed in South Canara as the rural population, which is mainly agricultural, reside in their holdings scattered over a wide area, and the so-called revenue villages are not capable of being formed into unions under the Act.

Finances.

The subjoined statement shows the income and expenditure of the local boards:—

TOTAL	2,16,256	100.00	TOTAL	2,21,405	100.00

Receipts.

The average annual income of the district and taluk boards during the five years 1888-89 to 1892-93 is Rs. 2,16,256, and the average annual expenditure is Rs. 2,21,405. The incidence per head of the population is for income 3 annas 5 pies and for expenditure 3 annas 6 pies. Of the total income 63.82 per cent. went to the district board and 36.18 per cent. to the taluk boards, while of the expenditure the former bore 49.60 per cent. and the latter 50.40 per cent. The chief source of income is the land cess, which is levied at the rate of an anna and half in the rupee on the rental. This tax gives about Rs. 1,14,000 or 53 per cent. of the total revenue. Tolls are the only other taxes, and they yield about Rs. 43,000 a year. There are fourteen toll-gates under the District Boards Act of 1884. The total income from

taxation is, on an average, about Rs. 1,57,000. This gives an CHAP. XVII. incidence of 2 annas 6 pies per head of the population, the average for the presidency being 2 pies more than this.

LOCAL BOARDS.

Receipts.

The principal sources of income, other than taxation, are contributions from provincial funds, chiefly in aid of education, school fees, ferry rents, market rents and bungalow fees. The receipts from these sources are shown under 'miscellaneous' in the appended statement. The large increase under this head in 1891-92 was due to the transfer of the management of certain ferries to the local boards under Madras Act II of 1890. The

Receipts from avenues.	marginal table shows the receipts from
RS.	avenues during each of the last five

1892-93 1,041	trees is 78,534. The revenue per mile
is Rs. 2.38, and the am	nount per each thousand trees is Rs. 13.26.

More than half the expenditure of the local boards is on Expenditure. account of roads and buildings and the engineering establishment required for their maintenance. Particulars of the communications of the district will be found in a separate chapter, but it may be mentioned here that there are 1,811 miles of road in the district. The mean expenditure on roads during the last five years was Rs. 43 a mile. The ratio between the cost of the engineering establishment and the amount expended fluctuates a

CHAPTER XVIII.

ECONOMIC CONDITION.

More than three-fifths of the inhabitants of the district are CH. XVIII. shown by the census returns to be dependent for their livelihood upon pasture and agriculture, and, as already explained, the real proportion is probably even higher, for many of those who appear in the tables under the head of general labourers are chiefly agricultural labourers. The position of the agriculturist, therefore, will serve as a true index to the condition of the people generally. If he thrives, his labourers will be well looked after, the merchant will drive a busy trade and the artisan will live in ease and com-The greater part of this chapter will, therefore, be devoted to the agricultural classes.

AGRICUL-

TURAL CLASSES.

Canara is particularly well adapted for the pursuit of agri- Facilities for culture. While the high Western Ghauts intercept the clouds, the lofty forests arrest them and cause them to precipitate their contents; and their joint action secures an unfailing and regular rainfall, averaging 140 inches a year. Famine is in consequence almost unknown in the district. The coast line presents a sub-soil of alluvial deposit which is admirably adapted for cocoanut plantations, while the numerous valleys formed by the unevenness of the surface in the interior are equally well suited for rice cultiva-The slopes of hills afford leaves for manure, grass for fodder and thatching, wood for agricultural implements and fuel, timber and stone for building, &c. All these are enjoyable, free of assessment, by the owner of the cultivation which adjoins the slope, to the exclusion of others within a limit of hundred yards from the cultivation-margin.

agriculture.

These facilities no doubt go a great way towards making Difficulties to agriculture an easy profession in Canara, but there are, on the other hand, numerous difficulties which the Canara ryot has to contend against before cultivation can be commenced. Owing to the unevenness of the soil, every spot before it can be cultivated has to be levelled with great labour by the hand of man, and even after the land has been brought under the plough, if it is neglected for a few years, it is soon broken up by deep gullies formed by the torrents which fall during the monsoon.

agriculture.

CH. XVIII.

AGRICULTURAL
CLASSES.

Difficulties to agriculture.

There is again no good indigenous breed of cattle, the bullocks used in agriculture being, for the most part, imported from Mysore. These are healthy and vigorous on their first arrival in the district, but from insufficient or bad feeding, exposure to the heavy south-west rains and bad stalling, they are soon rendered unfit for use or are killed off altogether. Such local breeding as does exist is of the worst possible kind, no attempt being made to control it by selection of either bulls or cows, the former being allowed to run at will with the herds. The result is, as Mr. Slight, the Head Assistant Collector, observes, "the common "breed of cows about the villages has most miserably deteriorated: "they are now wretched beasts about the size of a big dog." Whether it would be possible to obtain a good local breed of draught cattle by bestowing care on the selection of bulls and by paying greater attention to the rearing of young stock, it is difficult to say, but one serious consequence of the present system is that the resources of the district are annually drained of about two lakhs of rupees.

Status of the ryot.

In Canara there are no large middlemen between the State and the cultivator, such as the zemindars of the Carnatic, nor are there any big holders on favourable tenures, such as the shrotriemdárs and inámdárs of most districts. There are, no doubt, a few minor ináms in the district, but they consist entirely either of assignments of land revenue or of deductions from the bériz for the support of religious and charitable institutions and services. The general rule is that the State deals directly with the ryot and the tenure is essentially ryotwári. There is, however, some difference between the ryotwari tenure of South Canara and that obtaining in other districts of the presidency. In Canara lands of different kinds, of unknown extents and lying often in different places and even in different villages, constitute a holding, termed a warg,' and the assessment is fixed in lump thereon. Elsewhere. the land is divided into fields of convenient sizes and known extents and each bears a fixed assessment.

Of late, however, people have been allowed to apply for and obtain pattás for occupation of unoccupied Government waste land, subject to payment of assessment to be previously fixed thereon on measurement, and subject to conditions and restrictions prescribed in the rules laid down in that behalf. The holder, either under the old or new system, enjoys a proprietary right in his warg, subject only to payment of assessment to Government and is not divested of the property except by a sale of his land for default in paying the revenue or in execution of decrees of courts or by his own acts of resignation or private gift, sale, &c. He is at liberty to convert dry land into wet, to grow any crops

he chooses and to effect improvements to the land without liability CH. XVIII. to enhancement of the assessment. He can throw up his land1 at any time on giving notice to that effect, and his liability for the assessment thereupon ceases, but he must pay the tax for the current agricultural year (July-June) if he surrenders it so late in the season as to prevent its cultivation by any one else. may not destroy the land, but he is not bound to cultivate it.

AGRICUL-TURAL CLASSES.

Status of the

As already stated the operations of the Settlement Department Assessment have not yet been extended to South Canara, and there has been no of land. detailed classification and assessment of each individual field. It is not, therefore, possible to make any exact comparison of the assessment of lands in Canara with that found in other districts. but there is a general consensus of opinion among officers of experience that this district is very lightly taxed. At first sight the reverse might appear to be the case, for the average assessment for all kinds of lands, so far as an average can be computed on the present data, is about Rs. 3-6-0 an acre, and this is undoubtedly higher than the average for the presidency as a whole. But the character of the lands and the crops grown must be taken into consideration. About four-fifths of the cultivated area in Canara is rice land, and the product with the next largest extent under it is the cocoanut, which is still more valuable than rice. Now for such crops as these, Rs. 3-6-0 an acre is an exceedingly moderate rate, and cannot represent much more than one-tenth of the gross produce at present prices.

As a natural result of the security of tenure and the lightness Price of land. of the land-tax, the average price of land is high. Under the Bednore Government lands fetched as much as 25 and 30 years' purchase, but after the transfer of the country to Mysore, lands fell greatly in value. Colonel Munro reported that saleable land was confined to the coast or thereabouts, and that in the vicinity of the ghats lands were not only unsaleable, but that the greatest part of them was waste and overgrown with wood. Colonel Read reported in 1814 that land had revived in value since Colonel Munro's time, owing to security afforded to property and other causes, and that sales took place at 11 years' purchase. According to Mr. Malthy (1838) lands were frequently saleable at from 16 to 18 years' purchase. In 1848 Mr. Blane reported that there was difficulty in procuring land for purchase and there had been an increase in the price paid for it; and the value could be inferred from the fact of the "obstinacy with which the

¹ He must, however, relinquish the whole of his warg, and in this respect. the practice in Canara differs from that in other districts, where, subject to certain slight restrictions, any portion of a holding may be relinquished,

CH. XVIII.

AGRICUL
TURAL

CLASSES.

Price of land.

"possession of the smallest spot was contested and the shameful "manner in which every species of fraud and forgery were perpe-"trated to obtain or hold possession of it." The following facts are gleaned from registration statistics. In 1855 a holding, 8 acres in extent in the aggregate and consisting of bail, majal, bettu and garden, fetched Rs. 600 or Rs. 75 per acre. In 1870, 11½ acres were sold for Rs. 5,300 or at Rs. 481 per acre. 1880, the price per acre was Rs. 100 in one case reported and Rs. 240 in another. In 1885 the price was Rs. 76 per acre and in 1890 Rs. 200. In 1893, about 93 acres of land, consisting of wet, dry and garden, were sold for Rs. 23,045 or at Rs. 248 per acre. It is not possible to deduce much of value from these figures, as the plots of land differ so enormously in quality and sufficient instances have not been taken to allow of this difference being neglected. There can, however, be little doubt that the price of land has risen greatly in recent years. The value of land for sale used to be appraised at Rs. 100 for 6 to 8 muras net produce. The practice now is to value land at Rs. 100 for every two muras of rice net (i.e., deducting assessment, cost of cultivation, &c.).

Condition of the ryots.

With so much then in their favour, the ryots of South Canara ought to be in easy and comfortable circumstances, and this is the general opinion of officers who have served in the district. Mr. Comyn, a former Collector, considered that rather less than one per cent. of them were in affluent circumstances, that about oneeighth were well-to-do, that one-half were poor, but able to subsist on the produce of their lands without running into debt, and that the remaining 35 per cent. were very poor and involved in debt. The first class of ryots cultivate a portion of their lands and let out the rest on rent. The lands they retain they get cultivated by hired labour and merely superintend the cultivation. The rents of lands are generally received by them in kind, and their surplus income is invested either in acquiring fresh lands or in improving their existing property. The second class of ryots also cultivate partly through tenants; they live comfortably on the produce of their farms, but cannot save much. Any surplus that remains is invested in lands. The next class cultivate their lands themselves employing very little hired labour, and manage to subsist on the limited produce of their lands. Their surplus income is almost nothing, but such small debts as they contract they manage to repay without much difficulty. The last class of ryots are very poor, owning small estates, the yield of which is not sufficient for their subsistence. They habitually borrow and are nearly always in debt, but they are only occasionally driven to the necessity of selling their lands.

The proportion of very poor ryots is, however, undoubtedly lower than in most districts. This is clearly shown by the rent-roll statistics,2 for the proportion of ryots who pay the State less than Rs. 10 per annum is much below the average for the presidency, notwithstanding the fact that Rs. 10 represents more land value in the ryots. South Canara than it does elsewhere.

CH. XVIII. AGRICUL-TURAL CLASSES.

Condition of

Tenants are of four classes:—(1) Múlgénis, (2) Káyamgénis, Tenants. (3) Vaidagénis and (4) Chálgénis. The first class represents tenants possessing an hereditary right to hold their farms perpetually upon a fixed rent; the second those who hold on permanent rent or lease differing in name only from Mulgénis. The third class represents tenants who hold on lease for a limited period, while the fourth represents those who hold on temporary leases from year to year. In the southern parts of the district the land is usually held by tenants on short leases or at will, so that they have no incentive to extend or improve their holdings, but seek to get as much out of the land as they can before leaving. In the north Múlgéni or permanent leases are the rule. These are granted usually for a premium and a small annual rent, and the tenant is the virtual owner so long as he pays the rent. It is, therefore, his interest to extend and improve cultivation, all the benefits coming to himself and his descendants. Thus the estates of the larger land-owners, who do not cultivate themselves, appear to improve much more in the north than in the south, most of the increase and value being distributed among the tenants. The position of a Múlgéni tenant in fact differs but little from that of an ordinary ryot. The majority of the Chalgenidars, on the other hand, live from hand to mouth and are entirely at the mercy of their landlords. The better class of tenants are generally free from debt, if not in a thriving condition. Taking all kinds together, less than 5 per cent. may be said to be in good condition. while about 20 per cent. are obliged to contract debts on extraordinary occasions and to keep the agricultural stock and implements up to the required strength. A year's debt can only be paid next year, and there is a year's debt overhanging their heads unless a year of plenty should intervene and enable them to pay it off. The remaining three-fourths of the tenants are hardly better than farm labourers. They cannot subsist on the profits of their cultivation, are frequently in arrears in the payment of their rent and are obliged to borrow during the rainy season and to work for others. It does not follow, however, that their condition is to be deplored. Viewed as farmers they are undoubtedly poor, but

² See chap. ix. p. 161.

CH. XVIII.

AGRICUL
TURAL

CLASSES.

Labourers.

regarded as labourers, and that is their real position, they are decidedly well-to-do, for they possess a little land and may by this means eventually rise to the class above.

The agricultural labourers belong, for the most part, to the Holeva caste, which numbers about 120,000 if all its sub-divisions be included. They are of two kinds—farm-servants, employed all the year round or for the greater part of it, and mere field labourers, temporarily engaged for some particular work. The latter are the more numerous according to the census, but it may be doubted whether the distinction was made with much care in the schedules. Most of the farm-servants are bound to the land, either by a custom which is almost as strong as the actual bonds of slavery to which it owes its origin, or by an indebtedness to the land-owner from which the labourer finds it difficult to free him-These two classes are called, respectively, Múlada Holeyas and Sálada Holeyas, and their position and wages have been described in some detail in the first volume.3 It will be sufficient to state here that a man cannot, by his labour, support himself and a wife and family; his wife too must work and, as a rule, the children also must earn something as soon as they are old enough. The demand for labour, however, is good, and for six or eight months in the year work is always to be had on the coffee estates of Coorg and Mysore. It is estimated that about 100,000 of the labourers of Canara migrate there annually, and these receive wages sufficiently high to enable them to live in considerable comfort and save a little. Owing to this stimulus from outside and to the general well-being of the farming class in Canara, the condition of the labourer is, on the whole, somewhat better there than in most parts of the presidency, but the standard of comfort attained is far from high, and comparatively few Holeyas have any property beyond the bare necessaries of life.

Indebtedness.

In dealing with the subject of indebtedness it must be remembered that in India debt is much more freely incurred than in European countries. A man will not hesitate to pledge his land or his jewels to obtain a loan for the extravagant expenses of a marriage, and so far from his conduct being considered improvident or foolish, he would be regarded with disapproval and even contempt if he acted otherwise. Much of the indebtedness of the people is due to this feeling, but loans are also often taken for making improvements to farms, the purchase of cattle, and the like. As regards the proportion of agriculturists in debt and the proportion that their average indebtedness bears to their average

³ Chap. v. vol. i. pp. 198 and 210-213.

annual income, it is impossible to speak with any degree of accuracy. It has been calculated that the proportion of indebted agriculturists in the district does not exceed 30 per cent., while the proportion of their average indebtedness to their yearly income has been estimated at not more than 50 per cent. or half year's income. In bad years both proportions would no doubt rise, to be reduced again in a year of plenty. In fact here, as elsewhere, the economic condition of the poorer classes of rvots depends, in a great measure, on the season, but happily in this district bad seasons are comparatively of rare occurrence. The above estimate is necessarily rough, but speaking generally there is no doubt that debt is very common, and frequently very heavy, but those who are heavily in debt to one man are often creditors of many others, borrowing and lending being universal with those who have money. It is a mistake, therefore, to infer from the extent of indebtedness that there is a great deal of poverty. The amount of absolute poverty is extremely low in the district, and the general standard of comfort is decidedly high.

The usual rate of interest is about 12 per cent. per annum. It is lower when landed property is the security and higher when other kinds of property are pledged. The rates vary also with the amount of the loan, being higher when the sums are small and lower for large amounts. The rates of interest on mortgages for a series of years are given in the subjoined statement compiled from the statistics of the Registration department:—

<u>—</u>	Loans below Rs. 100.	Between Rs. 100 and Rs. 500.	Between Rs. 500 and Rs. 1,000.	Above Rs. 1,000.
Before 1835 Between 1835 and 1865	RATE PER CENT. 12 8 to 12	BATE PER CENT. 12 10 to 12	RATE PER CENT. 9 to 12 7 to 10	BATE PER CENT. 6 to 7 6 to 8

Prior to 1865 the interest was usually stipulated to be paid in kind, and the rates given in the foregoing table have been calculated with reference to the market values of grain at the time. Whenever interest is now paid in kind the rate is usually lower, being $2\frac{1}{9}$ muras as against 4 in former years; but it must be remembered that the market price of grain has nearly doubled. Professional money-lenders are comparatively rare, loans being usually made by the wealthier land-owners. It is a curious fact that, judging by the registration statistics, both borrowers and lenders seem to belong to the same class. Thus, in the north of

CH. XVIII.

AGRICULTURAL
CLASSES.

Indebtedness.

CH. XVIII.
THE NONAGRICULTURAL
CLASSES.

the district the majority of the loan transactions take place between Bráhmans, in the south between Máppillas.

Of the non-agricultural classes, the most important numerically are the toddy-drawers and fishermen. The district abounds with cocoanut and palmyra palms, and thus affords subsistence to a large number of toddy-drawers. Most of these live in comfort, while a few are in affluent circumstances. The majority of the fishermen are also pretty well off. Coming next to weavers, it will be seen from Chapter VIII that they have not been driven from their hereditary occupation by the importation of Manchester goods. It is doubtful whether their material condition has been seriously affected by the competition of Manchester, but it is certain that the competition has, to some extent, prevented the weavers from sharing in the general prosperity of the period of rising prices, and, as they have little or no land, this advance in the price of food-grains has been to their disadvantage. majority of them are in extremely poor circumstances; their earnings are scanty; their labour is often mortgaged in advance; their capital consists generally only of their simple loom, and they are among the first to feel the effects of a scarcity, as the demand for their wares ceases, and they seldom have any stock of food or money in hand to support them over bad seasons. The bulk of the other manufacturing classes are much better off than the weavers. The carpenter, the blacksmith, the goldsmith, the mason and the brass and copper workers generally command good wages and can rely with confidence on an unfailing income.

As regards general labourers, they are, on the whole, better off than the agricultural labourers. They are found chiefly in towns and their numbers must be much less than the figure given in the census tables. They can always get work and it is comparatively well paid. On the other hand, they spend a good deal of their earnings in drink and, like the agricultural labourers, have very little property on which to fall back when times are bad. Sickness, however, is practically the only thing that produces a cessation of or diminution of income, and the family system provides a very efficient substitute for the benefit club when this contingency arises.

SUMMARY.

To sum up: Of the labourers it may be said that, as long as they can work, they can always earn a wage which gives them enough for their simple wants, but leaves them little for saving, whether in the form of money, jewels, clothes or household utensils. Their lot is, however, improving owing to the demand for labour on the coffee estates in Mysore and Coorg and to a growing relaxation of the bonds which tied them to the land in the notvery-distant days when they were all agrestic slaves. There is no CH. XVIII. 'unemployed' difficulty, and an excellent system of mutual help Summary. takes the place of the poor law.

Above this class there is a considerable body of peasant proprietors who cannot live entirely on their land, but must supplement its produce by their earnings as labourers. These are often in debt, and it is, perhaps, a question whether it would not be better for the general good if there were fewer of such small farms.

Next to these again is the class of farmers proper, a class consisting essentially of peasant proprietors and, therefore, not wealthy in the sense in which a farmer of the Lothians or the Fens is wealthy, but still in comfortable circumstances, possessing not a little property in cattle, jewels, silk cloths, metal, household vessels, &c., and though frequently in debt, seldom oppressed or overwhelmed by it.

Lastly, there are the great landlords, men of considerable wealth, who add to their income from land by lending money on interest, and sometimes by trading in grain.

To those who know India this is, on the whole, a bright picture, comparing favourably with what is found in other districts and being a vast improvement on the condition of the people at the beginning of the century, when the district had been reduced to ruin by the unrestrained exactions and frightful cruelties of Hyder and Tippoo. Nor is the future outlook a gloomy one. The rate of increase of the population is not a high one and there is still much land available, while the opening up of the country by railways, which is in contemplation, will give an impetus both to agriculture and trade which cannot fail to be beneficial. The development of industries other than agriculture is much to be desired, but it is not so pressing in South Canara as in other parts of the country, and it must necessarily be left to private enterprise. All that the Government can do is to provide security and speedy justice, to encourage and assist education, to remove all hindrances to trade and to improve the means of communication. The rest must be left to the people themselves.

CHAPTER XIX.

GAZETTEER.

CHAP. XIX.

AMINDIVI ISLANDS.

AMINDIVI ISLANDS.

General description.

THE Amindivi Islands consist of a group of five islands—Chetlat. Kiltan, Kadamat, Amini and Bitra-running nearly parallel to the line of the coast at a distance of 170 to 200 miles, besides a few isolated reefs. They form the northern group of the Laccadives. Each of the islands is situated on an extensive coral shoal, with an area of from 2 to 3 square miles. Their surface is flat and no part of any of these formations rises more than 10 or 15 feet above the level of the sea. Around each island a more or less extensive fringe of coral reef extends, broader and more shelving on the west, where the island naturally most requires protection. and narrow and abrupt on the east. The outer edges are higher than the body of these shoals, and extending, as they do, in a semicircle at a distance of 500 vards to three-fourths of a mile round the west, generally enclose a regularly formed lagoon, in some of which the water is so still that in the worst weather coir or cocoanut fibre may be soaked without danger of being washed away. The body of the island is the more perfect development of the eastern and protected side of the coral formation. The same feature characterizes all these shoals, and leads to the theory that they rose to the surface in the form of circular or oval shallow basins, and that under the protection of the shoal the east rim gradually developed itself towards the centre and formed an island. This theory is strengthened by the fact that in some of the islands this gradual increase towards the lagoon is still going on. The receding tide leaves the outer edge of the reef nearly dry and the tide-water passes out of the lagoon by two or three breaches in the outer rim which are sufficiently large to admit the light native craft into the natural harbour, several feet deep even at low tide, formed by the lagoon.

Soil.

The foundation of the soil in all these islands is a stratum of coral or limestone, which, varying from 1 foot to $1\frac{1}{2}$ feet in thickness, is seemingly above the highest level of the water, and, being of a piece with the whole formation, stretches uniformly throughout the portion of the shoal which is above sea-level. Beneath

this crust the soil consists of loose wet sand and by removing a few CHAP. XIX. spadefuls to allow the water to accumulate, a pool of fresh water may be obtained in any part. All wells, tanks and pits for soaking coir (where soaked in fresh water) are made by breaking through Soil. this crust and taking out the sand. The sand gradually presses towards this excavation, and from its constant removal, some of the wells and tanks extend under this vault of coral for some distance all round. The water in these wells is quite fresh and always abundant; but it is affected by the tide, rising and falling several inches; it is said to be not very wholesome, but recent analyses throw doubt on this statement. Above the crust the soil lies to a depth varying from 2 to 6 feet, generally composed of light coral sand, which is finer than common sea-sand, but quite as dry. In some parts the soil is entirely composed of small loose pieces of coral without any other soil, a condition which is said to be particularly well adapted to the cocoanut. The surface soil is naturally so barren that there is little or no spontaneous vegetation in most of the islands. An attempt was made by breaking up the surface crust of coral in part of Amini to make a soil on which food grains could be grown, and a little dry grain was produced for a time; but the experiment was found so unsatisfactory that it has been given up, and it only shows that the prosperity of the islands must always depend entirely on the cocoanut.

ISLANDS.

The health of the people is generally good and they live to a Climate and considerable age. Women suffer chiefly from want of proper health. treatment in confinement, and the mortality of infants is very Men suffer chiefly from eye diseases, the effect of the intense glare of the white coral sand, and from rheumatism, the effect probably of constant exposure in fishing or looking after the soaking of the coir. There is a dispensary in Amini, with a Hospital Assistant, and a trained midwife was also attached to it, but she has since resigned.

For two and-a-half centuries the Laccadive Islands formed part History. of the small principality of Cannanore, having been conferred as jágír on that family by the Chirakkal Rájá (about 1550 A.D.). In 1786, the northern islanders revolted and transferred their allegiance to Mysore. In 1799, when Canara fell to the East India Company. these islands, the present Amindivis, were not restored to the Bibi of Cannanore, but a remission of revenue (Rs. 5,250) was conceded instead; hence the different status of the two portions of the group. Such revenue as is derived from the Laccadive Islands has, for more than a century, been obtained from a monopoly of the staple produce—coir. The entire outturn is claimed by the Government in the northern or Amindivi group. The article is bought from

AMINDIVI ISLANDS. History.

CHAP XIX. the producers at fixed prices, and is sold on the coast at the market rates; the difference constitutes the revenue or profits of trade of the Government. No change has been made for many years in the price which is given by Government for the coir produced in the Amindivi group. Payment is made partly in rice and partly in money.

Administra-

The islands are scheduled tracts, i.e., the ordinary law of India does not apply to them until it is specially extended. administration is of a patriarchal character, the chief representative of the Government being an officer styled the Monegar (pay Rs. 85 per mensem). He is a Magistrate of the third class and administers the criminal law according to the Penal and Criminal Procedure Codes. Persons charged with grave offences are sent to the mainland for trial, but such cases occur very rarely. In addition to the ordinary law there is a body of 'customs,' and the monegar has power to punish with fine any person who commits a breach of these customs. Thus adultery, which, under the codes, is an offence that can be inquired into only by a first-class Magistrate, is an offence against custom and the monegar punishes it by fine. It is the same with defamation. By this authority also he enforces such customs as joining in 'koots' or general assemblies for the purpose of destroying rats, or of clearing the entrances to the lagoons when they are blocked up by the growing coral, or of beaching and launching big boats, or other works of public utility which could not be efficiently done by individuals for themselves. Among other offences which he has at times punished as contrary to the custom of the people or to good morals and public safety are witchcraft, being out after dark under suspicious circumstances, being suspected of theft, and turning a sister out of doors. The monegar also deals with disputes of a civil nature and in this capacity he is usually assisted by a pancháyat of elders, called Moktessors in Amini and Múpamárs in the other islands. The monegar resides in Amini, but he keeps a peon in each of the other islands. This peon acts as a police officer, but there are also other petty watchmen called Nadpals. Lastly in each island except Bitra there is an accountant called the Karani. There is no land tax or indeed taxation of any sort except court fees, and the revenue is derived solely from the coir monopoly. The net revenue obtained from the islands necessarily varies with the produce of the cocoanut trees. In 1890-91 it was over Rs. 9,000, but in many years there is a considerable deficit.

The people.

The total population of these islands, according to the census of 1891, is 3,722. The people are all Musalmans, and, like the Mappillas of the neighbouring coast, of Hindu descent. A tradition is preserved among them that their forefathers formed part

of an expedition from Malayalam which set out for Mecca in search CHAP. XIX. of their apostate king-Bharman Perumál-and was wrecked on these islands. The inhabitants were certainly Hindus for long after their first settlement, and were probably converted to Islâm The people. not more than 250 or 300 years back. They retain some of the general distinctions of caste as well as the law of Alaya Santána, but with some local modifications. The systems of filial succession (makkalasantána) and succession of the nephew (alaya santána) are practised side by side. Some families follow one, some the other. It sometimes occurs that the ownership of property descends in one family by one system, while the permanent tenancy right descends by the other system. As most of the families are closely connected by frequent intermarriage, the claims are sometimes very complicated when disputes arise.

Monogamy is universal, and the women appear in public freely with their heads uncovered. The language is a corrupt form of Malayalam, which is, however, written in the Arabic character. The headmen and pilots of most of the islands know a little Arabic. The inhabitants are bold seamen and expert boat-builders. In 1880 they owned 91 large and 297 small boats. They use some crude nautical instruments which are made in Minicoy. captains of kundras (big sea-going boats) usually study navigation under experts who come from Minicoy to teach them.

The dwelling houses are substantially built of limestone; they are untidily thatched and are terribly dark and dirty inside. But in recent years the people of Amini, under the influence of the Monegar, have greatly improved the style and comfort of their houses, which now contrast very favourably with those of the ordinary villagers on the mainland in their appearance of comfort and the general cleanliness of their surroundings. Except during the rains the islanders live almost entirely in the open air: in Kiltan and Chetlat every one sleeps at night on the shore of the lagoon to get the benefit of the breeze.

The chief and almost sole cultivation is that of the cocoanut Products and palm: the corresponding chief industry is the preparation and exportation of cocoanut fibre (coir). The soaking of coir and the other processes connected therewith are mainly conducted by the women. The men convey the produce of the islands—coir, cocoanuts, jaggery, &c., besides tortoise shells and cowries—to the mainland. The island of Amini was formerly noted for the production of superior limes, but their growth has been almost abandoned. The bread-fruit tree (Artocarpus incisa) is common, and its fruit is better than that produced on the mainland, where the tree is called 'Divi halasu' or 'Divi jack,'

ISLANDS.

CHAP. XIX.

AMINDIVI
ISLANDS.

Places of

interest.

Amini: Population 2,150. It is the principal and most populous island of the group. It is about 2 miles in length by over a mile in width. The surface is very even, and in no part more than about 10 feet above sea-level. The island almost entirely fills the coral enclosure, so that there is very little lagoon between it and the reef. The houses are scattered all over the island. As many of them are at some distance from the shore, the coir is commonly soaked in fresh water pits instead of in the sea. If these pits are not frequently cleaned out, the coir from them is of an inferior quality. The island is divided into four grámans—Pallic'chéri, Idanéth, Purakkéri and Kótechéri. The principal inhabitants of this island have an acknowledged superiority, and exercise considerable influence over the inhabitants of the other islands.

Kadamat: Population 338. This island lies due north from within sight of Amini, at a distance of 6 or 8 miles. The coral formation on which it stands is very extensive and the lagoon enclosed by the reefs is very large, well stocked with fish, and much frequented by the people of Amini on that account. The island is long and narrow, probably 3 to 31 miles long by threefifths of a mile broad. The body of the island appears generally lower than that of any of the others, and has an excellent natural protection against the weather in a ridge of low sand drift which runs down the west side. The superficial area of this island must be considerably greater than that of any of the others, and the natural fertility of its soil exceeds all. Only a small portion as yet is planted with cocoanuts, and this has been done mostly by people of Amini. The inhabitants were formerly all tenants and dependents of these Amini people, but most of them have now thrown off that yoke and have boats of their own in which they export their own coir and other produce. It is still the most backward of the group.

Kiltan: Population 723. This lies about 20 miles from Amini in a north-easterly direction. Though the smallest of the group it ranks next to Amini in the general prosperity of its inhabitants. A large number of them were carried off by cholera in 1893. The superficial area of Kiltan may be about $1\frac{1}{2}$ square miles and the reef on which it stands is extensive. The lagoon is large, but shallow and is rapidly filling up, and even now there is not sufficient water within it at low tide to float one of the native kundras if laden. Within the last fifty years many feet of land have been gained towards the lagoon. The reefs are sufficiently extensive to protect the shore effectually, all the coir is soaked in the sea-sand, and trees are planted to the water's edge on every side.

Chetlat: Population 511. This is the most northerly of the CHAP. XIX. group and lies about 15 miles distant from Kiltan and 25 to 30 from Amini. The shoal on which it stands is extensive, the lagoon is large and very perfect and the shores well protected. The Places of island is from 2 to 2½ miles in length and about three-fourths of a mile broad. The surface is not so even as in the other islands, and a ridge of low sand drift running up the middle prevents, or at least retards, plantation in this island. Though not in nearly so backward a state as Kadamat, it is naturally the least promising of the islands. The soil is very poor, the trees very slow of growth and not productive. Low mounds of sand occupy a great part of the centre and best protected parts of the island, on which nothing grows except scanty crops of a plant called tirni, on the roots of which a small ball, about the size of a pea, grows. After the plant has withered these are gathered from among the loose sand and used by the islanders. Dry cultivation on this island is very insignificant. Some limestone is exported from the island to the coast, and good mats are made here though not exported. It has been the scene of several wrecks.

Bitra: This is not half the size of the others described above. but the shoal on which it is situated is very extensive and abounds with fish, and is on that account much frequented by the islanders, chiefly those of Chetlat. The island is sacred to a 'Pir' whose tomb stands in the middle of it, and there are from 150 to 200 trees planted round it as votive offerings to his manes; the fruit of these is used by any of the fishermen who happen to land there. The greater part of the island is covered with a thick low brushwood among which, till within the last fifty years, extraordinary flocks of sea-birds laid their eggs and bred: but now not one remains, all having, without any apparent cause, migrated, it is supposed, to the Maldives. The soil is said to be excellent and the cocoanut tree grows rank and luxuriant. The want of fresh water has impeded the occupation of this island. When the fishermen run short of water they dig a hole in the sand near the sea, and use the brackish percolations from the sea in preference to the well water. Rats are numerous and visitors now and again make a raid on them.

Reefs: There are four open reefs. The most northern is Beliapáni, which is of considerable length and only shows two small spaces above water at high water. Boats can get inside the reef.

CHERIAPÁNI lies 18 miles south-west from Beliapáni. It is better known as the Byranhor reef and no part of it is above water at high water. Boats can get inside the reef, and it is the

ISLANDS.

AMINDIVI TSLANDS.

CHAP. XIX. favourite fishing ground. It is much larger than Beliapáni and the stem of an iron ship is still visible on it.

Places of interest.

PERMULLEE is a reef due west of Amini 45 miles. A small portion is above high water-mark and is usually occupied by a large number of sea-birds.

ELEKALPINI lies 30 miles east of Kiltan and is some 30 fathoms below the surface.

COONDAPOOR TALUK.

COONDAPOOR.

General description. THE Coondapoor taluk is the smallest and most northern of all the taluks of South Canara. It is bounded on the north by North Canara; on the east by Mysore, the line of boundary being, except in a few places, the summit of the Western Ghauts; on the south by the Udipi taluk; and on the west by the Arabian Sea. It has an area of 512 square miles. The sea-board is about 28 miles long, and the distance from the coast to the Western Ghauts is about 25 miles in the southern part of the taluk.

Hills.

The northern and eastern parts of the taluk are full of long spurs from the Western Ghauts, covered with dense forests.

Rivers.

The taluk is traversed by seven rivers, of which the Kollúr. Haladi and Chakranadi are alone of any importance. These rivers are navigable to a small distance from their mouths.

Soil.

There is the usual plain near the coast with a sandy soil mixed more or less with alluvial land, and then come the laterite plateaux and valleys, and after that spurs from the ghats. formed by the three large rivers, which join to form the lagoon at Coondapoor, is singularly fertile and full of islands well adapted for cocoanut or sugarcane plantation as well as for rice, and good soil extends well up all the three valleys.

Forests.

There is much more forest in Coondapoor than in Udipi or Mangalore, and on the laterite plateaux and slopes to the north of the taluk there are large numbers of catechu trees (Acacia catechu and Acacia sundra). Near the cultivated lands on the coast the jungle has been coppied for manure, and some parts have been completely cleared, but not to the same extent as in the Udipi and Mangalore taluks,

Fauna.

Wild animals abound in Coondapoor, but are found chiefly on the slopes of the Western Ghauts. The bison and the sambar are very frequently met with all along the line of the ghats from The tiger and the cheeta or leopard both abound north to south. and commit great havor on the agricultural stock of the taluk.

The taluk is on the whole a healthy one, but its climate is CHAP. XIX. characterised by excessive humidity during the greater part of Coondapoor. the year. It has a relaxing and debilitating effect on Europeans, Climate. especially women and children, who become pale and anæmic after prolonged residence. The average annual rainfall is 125 inches on the coast and 140 inches in the interior; at the foot of the ghats it is even more, as there the rain-charged clouds drifting inland are sharply intercepted by the mountains.

The total length of roads in the taluk is 144 miles, and the Communiroads are classified as follows:-

Number and length of Roads.

Number.	Fr	om			То	Distance in miles		
17	Coondapoor		•••		Haladi		•••	14

						TOTAL		144

As the taluk is small it must be considered well supplied with roads. All the roads are under the Taluk Board, and none of them form part of any important line of through communication. The principal road is No. 20 from Wandse (which has water communication with Coondapoor) to Laximpur on the Mysore frontier. About 15 miles from Wandse it begins to ascend the Kollur ghat, and after passing through the Mysore territory for about a mile traverses the Hannar Mágané of the Coondapoor taluk which lies above the ghats. The length of 30 miles includes a short branch to Hannar and thence on to Benhatti on the Mysore frontier. Next in importance to this—and more than equal to it so far as through traffic is concerned—is the Road No. 18 from the boundary half way up the Hyderghur ghát to Sankaranáráyana whence there is water communication with Coondapoor. Road No. 21 from Halkal to Baindúr puts the Kollúr ghát in communication with the port of Baindur, and with North Canara vià the coast road. As in other parts of South Canara, the coast road has been neglected, the rivers and backwaters being too large to be

Communications.

CHAP. XIX. bridged; the road has, therefore, little value as a line of through COONDAPOOR. communication. Road No. 17 from Coondapoor to Haladi is continued through the Udipi taluk to the Agumbi ghát road from Shimoga, but the bulk of the traffic leaves the road for water communication at Haladi, Road No. 20-A from Coondapoor to Wandse is a mere bridle-path at present, but it is being opened out to full width. There are three broad streams to cross in a length of 7 miles.

> In connection with the roads the following means of water communication are available: (1) Coondapoor to Wandse (10 miles), (2) Coondapoor to Haladi (12 miles). The northern river, which combines to form the backwater or large lagoon at Coondapoor, is also navigable to Aribail at a distance of about 21 miles, but there is no road in connection with it. The Baindúr river is also navigable for about a mile and-a-half.

History.

Coondapoor and some other ports on the coast were, in the early part of the sixteenth century, seized by the Portuguese, and the more inland tract was included within the kingdom of Vijayanagar until its overthrow in 1565. Subsequently this territory became part of the Bednore State, and Coondapoor was one of the principal ports of the Rájá; on the overthrow of the latter by Hyder Ali in 1763, it was incorporated with his dominions, and when Tippoo fell in 1799, it became part of the British district of North Canara. On the partition of that district in 1860 it was temporarily attached to Bombay.

In addition to the taluk proper there is a small tract of land above the Western Ghauts, known as the Hannar Magané. which formed part of the endowment of the Kollúr temple at the foot of the ghats, and being thus always treated as part of the Coondapoor taluk, it came into the possession of the British alone with the rest of South Canara. It is entirely surrounded by Mysore territory, but on the west it is only separated by a distance of about a mile from the rest of the taluk.

Administration.

The taluk lies in the Head Assistant Collector's division, whose head-quarters are at Coondapoor. The chief local revenue officer is the tahsildar (salary Rs. 150). He is also a magistrate, but the bulk of the magisterial work is performed by the stationary sub-magistrate at Coondapoor. The taluk forms a single police division under an inspector, and is divided into seven police-station charges. In respect to civil actions it lies within the jurisdiction of the district munsif of Coondapoor. The number of villages is 190 and all of them are inhabited.

Population.

The population in 1891 was 120,268, of whom 55,092 were males and 65,176 females. Hindus number 111,805, Musalmans

5,122, Christians 3,063 and Jains 278. The population has CHAP. XIX. increased by only 4.48 per cent. since 1881, and there are now 235 Coondapoor. persons to the square mile. The number of occupied houses is Population. 22,266, and there are on an average 5.40 inmates to each house. Of the male population 86.95 per cent. are illiterate, 9.54 per cent. can read and write, while 3.51 per cent. are learning. Of the females 99.48 per cent. are illiterate. Canarese is the mothertongue of 94,845 persons, Konkani that of 14,938, Maráthi that of 5,163 and Hindustani that of 2,450. Classified according to occupations, the population consists of 68,103 landholders and tenants, 2,386 agricultural labourers, 23,497 general labourers, 11,800 traders, 146 weavers, 7,807 other artisans and 6,529 persons of various other professions.

The area of ryotwári land in the taluk is 326,900 acres and The land. that of minor inams is 799. There are neither whole inams nor zemindáris. Of the ryotwári land about 144,200 acres are under forest and 78,700 acres are not available for cultivation. Of the remainder 51,500 acres are occupied, and the area available for extension of cultivation is thus 52,500 acres. The area cropped in 1892-93 was 46,700 acres of ryotwári land and 706 acres of minor inám or about two-fifths of an acre per head of the population. Rice is the principal crop and is grown on nearly 48,400 acres. There are about 5,000 acres under other food-grains and pulses, and 225 acres under sugarcane. There were in that year 4,661 single pattás, of which 1,391 were for sums below Rs. 10. The normal land revenue of the taluk is Rs. 2,10,000 and the cesses charged on land revenue amount to Rs. 30,000.

The principal sources of irrigation are the seven rivers mentioned above, besides several private wells. The crops, however, chiefly depend upon falling rains, and there is no regular system of irrigation in the taluk.

The agricultural stock in the taluk is shown in the marginal

			table. Interpreting ploughing

100 inhabitants against a district average of 18; and there are about 9 sheep and goats to every 1,000 acres in occupation, the average for the district, as a whole, being 17.

Coondapoor: Population 3,617, of whom 2,765 are Hindus, 493 Musalmans and 359 Christians; taluk and divisional

HH

The land.

CHAP. XIX. head-quarters; police station; post office; sub-registrar's office; COONDAPOOR. local fund hospital; distance from Mangalore 53 miles, north. town is situated on the south of an estuary receiving five fresh water rivers. It was formerly one of the principal ports of the Bednore Rájás, after the disruption of the Vijayanagar kingdom. In the sixteenth century, the Portuguese settled here and built a fort which still exists a little inland from the village, and a strong, well-built redoubt on the sea face, built by Hyder, commands the entrance to the river. On this redoubt now stands the Head Assistant Collector's office and residence. In 1793 General Matthews landed at Coondapoor and marched against Bednore vià Hosangadi. After being for a quarter of a century under Mysore, the town fell to the British in 1799, and was included in the district of Canara. On the partition of the district in 1860, this part of it was temporarily attached to Bombay. The town is healthy, but its trade is languishing. Rice is produced in the neighbourhood. At no great distance from the town, there was a tank of fresh water, in which was a kind of fish called by the natives pú minu or the flower fish. It was reserved for Tippoo's use, being large, fat and full of blood.

Places of interest.

Basrúr: Population 1,950, of whom 1,534 are Hindus, 309 Musalmans and 107 Christians; post office; seaport; distance from Coondapoor 4 miles, east. It was once a large walled town with a fort and temple, and is mentioned as an important trading place by all the Arabian geographers. Though now almost deserted, the walls and water-gates still remain in good preservation. Basrúr was known amongst the early geographers by the names of Barcelore, Basilór and Barkalúr, and was supposed by some to be the Barace of Pliny. A Ráni of Basrúr is mentioned by Ferishta as having paid her respects to Sankara Náyak, a Yádava king of Dévagiri, early in the fourteenth century. In 1514 Duarte Barbosa mentions that many ships came to Basrur from Malabar and others from Ormuz, Aden and Zeher. The Ráni of Gairsappa ceded Basrúr to Bijapúr between 1570 and 1580, but the cession never took practical effect, as it was resented by the local underlord of the Vijayanagar rulers who had by that time become independent at Barkur, and asserted his authority successfully, completely overthrowing the local Jain chiefs. In the sixteenth century Coondapoor or lower Basrúr became the possession of the Portuguese, and early in the eighteenth century a Dutch factory was also established there. In 1764 the Ikkéri Rájás agreed to exclude Musalman traders.

Baidúr or Baindúr: Population 2,157, of whom 1,933 are Hindus, 177 Musalmans and 46 Christians; police station; seaport; office of sub-registrar; post office; travellers' bungalow CHAP. XIX. maintained by the taluk board; chatrams; distance from Coonda- COONDAPOOR. poor 18 miles, north-north-west. It had once a fort which belonged Places of to a Jain princess named Baira Dévi. This family was destroyed interest. by Siva-bhaktars, and the place has ever since been on the decline. From the ancient temples with inscriptions, Baindúr appears to have been a place of some importance in the time of Vijayanagar supremacy and probably at an earlier date. It was mentioned by Duarte Barbosa in 1514 as exporting rice to Bhatkal.

Kandávar: Population 1.011. It is a small Bráhman village, from which a section of Canarese Bráhmans takes its name.

Kótéshwar: Population 1,568; Kótéshwar is said, in the Malabar Kéralólpatti, to have been the capital of Tulubhan Perumál, the first separate king of Tuluva. It was one of the most important Bráhman settlements at the time of their introduction by Mayura Varma, or very shortly after.

Shirur (literally village of the goddess Lakshmi): Population 748; distance from Coondapoor 20 miles, north-north-west. It is a small port on a creek which forms the northern limit of the presidency. The ruins of ancient Chirur are extensive in the neighbourhood.

Hosangadi: An insignificant village, 18 miles east-northeast of Coondapoor; police station; chatram. It was much used in the campaigns with Tippoo, as it lies on the route between Bednore and the Malabar coast. When General Matthews marched on Bednore from Coondapoor in 1793, the principal stand was made at Hosangadi, when the positions were stormed by the 42nd Highlanders. It has given its name to a mountain pass, which is practicable for carts as far as the head of water communication with the coast.

Uppunda: Population 2,638, of whom 2,546 are Hindus; distance from Coondapoor 15 miles, north-north-west. There is an old Hindu temple dedicated to Durga, which contains three inscriptions of some archæological value.

Sankaranáráyana: Population 2,768, of whom 2,691 are Hindus; police station; 12 miles from Coondapoor and 51 miles north of Mangalore. There is a large temple in this village dedicated to Sankaranárávana.

Kirimunéshwar: It is a hamlet of Nágúr village situated 10 miles north-north-west of Coondapoor. It contains a local fund chatram, and there is a travellers' bungalow maintained by the taluk board. The large agraháram was destroyed about 1790 A.D. by a band of Mahráttas under Bálá Rao.

CHAP. XIX. COONDAPOOR.

Places of interest.

Kodachádri: Peak of the Western Ghauts forming the boundary between the Shimoga district of Mysore and the Coondapoor taluk. Height above sea-level 4,411 feet. A well-known landmark. On the Mysore side it rises 2,000 feet from the plateau and is clothed with magnificent forest. Towards the west it falls precipitately to the plain of Canara for 4,000 feet, and affords a view as far as the sea. Half-way up is a temple to Huli Déva, the tiger-god. It used to be known to mariners as False Barcelore Peak.

Kódi: Population 2,170; distance from Coondapoor 2 miles, south; from Mangalore 33 miles, north-north-west. It is situated on the peninsula between the Coondapoor backwater and the sea, and has a lake of brackish water containing large fish.

Gangóli: Village; port; population 1,142; distance from Coondapoor 1½ miles, north-north-west. It is situated on the north bank of the Coondapoor river, near its mouth. Tippoo had a dock here. It is the port of Coondapoor town.

KÁSARAGÓD TALUK.

Kasaragód.

General description. THE Kásaragód taluk is the southernmost taluk of the district, and is bounded on the north by Mangalore and Uppinangadi; on the east by the Uppinangadi taluk and the province of Coorg; on the south by Malabar; and on the west by the sea. The seaboard is about 55 miles in length, and the greatest breadth from the sea to the Coorg frontier is about 26 miles. The estimated area of the taluk is 1,032 square miles.

Hills.

The eastern part of the taluk is full of long spurs from the Western Ghauts, covered with forests.

Rivers.

There are six rivers in the taluk, all of which take their source in the Western Ghauts and fall into the Arabian Sea. They are navigable to a short distance from their mouths.

Soil.

Along the sea-board there is the usual low-lying sand intersected by backwaters or estuaries, with the usual narrow strip of sand between the backwaters and the sea. Then come the laterite hills or plateaux which, near the coast, are like swelling downs, but farther inland are specially high and often ridge-like with deep valleys to correspond, thus affording great facilities for areca-nut cultivation, which is carried on more successfully in the valleys around Vittal to the north-east of the taluk than in any other part of the district, except the Hannar Mágané of Coondapoor. In the

northern part of the taluk the hills are very bare, but midway, CHAP. XIX. and especially between the two branches of the Chendragiri or KASARAGÓD. Paiswani river, there is a larger amount of good forest. Kumari Soil. is habitually carried on, and the hills, save a certain portion of bare rocky plateau and the tracts actually under cultivation, are covered with jungle varying from one to ten years' growth. The soil of the southern part of the taluk near the sea is more than usually sandy, but there must be a good deal of alluvial soil mixed with it as it bears good crops.

The eastern portion of the taluk is covered with dense forest, Forests. which begins from 20 to 30 miles from the coast. The hill slopes, adjoining the areca-nut plantations in the Vittal Mágané, consist of some bare spots of hard laterite plateaux which seem to produce nothing but thatching grass.

Wild animals are found near the slopes of the Western Ghauts. Fauua. The bison and the sambar are very frequently met with all along the line of the ghats. The porcupine and the scaly ant-cater are not infrequent. The flying fox (Pteropus medius) has established flourishing colonies at Kumbla. Oysters are met with all along the coast, a large kind being found at Mogral near Kumbla.

The communications of the Kásaragód taluk are extensive and Communicacontinue to progress under the taluk board.

The roads are as follows:-

tier		71
No. 3-A from Kangangád river to Hosdrúg		- 3
No. 6 from Puttúr to Manjéshwar (viá Vittal)		24
No. 7 from Perdal to Kumbla		10
No. 8 fr. m Kásaragód to Jalsúr		31
No. 22 Coast road	••	57
Total		196

The roads are now all under the management of the taluk board, but the old numbering of the district board has not yet been changed. The mileage is greater than that of any of the other taluks of the district, and in addition, the northern frontier of the taluk from Pane-Mangalore to Jalsur is skirted by the main road from Mangalore to Mercara, which in fact enters the taluk here and there though it is classed as an Uppinangadi road. On the other hand, the mileage of roads Nos. 3 and 22 is illusory, the last 20 miles or so of road No. 3 never having been properly opened out owing to the traffic all going by water after the Kangangád river is reached. From the same cause the last 18 miles of the

Kásaragód. Communications.

CHAP. XIX. coast road (No. 22) are left in their original sandy state for the use of a few foot-passengers. Until within the last few years other sections of the coast road were similarly neglected, but the worst stretches of sand between Mangalore and Hosdrug, from which there is water communication with Malabar, have now been gravelled and earts travel freely along the road, which in a few years will be in as good a state as a road can be which is crossed by a number of large rivers and backwaters and for the bridging of which funds are not forthcoming. The road from Pane-Mangalore to the Malabar frontier was constructed as a military road to be bridged throughout and kept open all the year round, but it is very circuitous and passes through so inhospitable a country that ordinary traffic prefers the coast road despite its backwaters. There is, however, a certain amount of local traffic on the road, and it is well worth keeping up with a moderate annual maintenance allowance. Several of the bridges have fallen down, having been built, for the sake of economy, with the laterite available on the spot, which turned out to be unfit for bridge work. Road No. 8 from Jalsúr to Kásaragód is a useful road, as it brings traffic direct from Coorg as well as from the interior of the taluk to the port of Kásaragód. The remaining two roads bring the produce of the interior to the ports of Manjéshwar and Kumbla.

> In addition to its roads the Kásaragód taluk has considerable facilities for water communication, viz.:-

	MILES.
From Pane-Mangalore to Mangalore	. 18
From Hosdrug to the Malabar frontier .	. 20
Total .	. 38

The above are the only two water routes which are in direct communication with roads (the Mangalore and coast roads in particular), but all except the smallest rivers are navigable for some distance inland for boats carrying 3 tons or even more. Thus the Uppala river to the south of Manjeshwar is navigable for about 4 miles to Majbail in the dry weather and to Paivilike, or about 6 miles, in the wet season. The Shire river is navigable at all seasons for about 10 miles to Bádúr, and a few miles farther in the wet season. Boats go up the Mogral river for about 4 miles, and the Chendragiri river is navigable for 10 miles to Shavikere on the Paiswani branch, or Kudumpur on the Palar branch. The Békal and Chittari rivers can scarcely be called navigable, but small boats go up about 2 miles. Three navigable rivers find their outlet at Kavov. The first, the Kangangad river, has already been mentioned as being navigable for about 20 miles, and the next branch, the Kanhangád river, is navigable as far as Kunhangai, about

the same distance from the sea, or 9 miles from the junction. CHAP. XIX. The third river only skirts the Canara frontier for a few miles.

KASARAGÓD.

The Kásaragód taluk originally formed the southern portion of History. the ancient Tuluva kingdom, and was separated from the kingdom of Kérala by the Chendragiri river which was formerly called 'Perumpula.' One of the four Brahman governors who were appointed by Mayura Varma had his seat at Kasaragod. In the taluk will be found the ruins of several forts built by Sivappa Návak of Bednore between 1650 and 1670 A.D. The two forts at Békal and Chandiagiri were originally under the Kollatiri or Chirakkal Rájás until the time of Sivappa Náyak's invasion, after which they formed part of South Canara. The territory of the Rájás of Níléshwar, who were a branch of the family of the Zamorin of Calicut, was annexed in 1737 during the reign of Sómasékhara Náyak.

The taluk lies in the General Duty Deputy Collector's division, Administrawhose head-quarters are at Puttur in the Uppinangadi taluk. The chief local revenue officer is the tahsildar (salary Rs. 200). He is also a magistrate, but the greater part of the magisterial work is done by the stationary sub-magistrate at Kásaragód. There is a deputy tahsildar at Hosdrug in charge of the Nileshwar division. The taluk is divided into 24 máganés which are subdivided into 243 villages, all of which are inhabited. The taluk forms a single police division under an inspector, and is divided into eight police-station charges. In respect to civil actions it is situated within the jurisdiction of the district munsif of Kásaragód.

The population in 1891 was 280,659, of whom 137,600 were Population. males and 143,059 females. Hindus number 216,946, Musalmans 56,731, and Christians 6,731. The population has increased by 15.08 per cent. since 1881, and there are now 272 persons to the square mile. The number of occupied houses is 50,890, and there are on an average 5.52 inmates to each house. Of the male population 85.90 per cent. are illiterate, 10.77 per cent. can read and write and 3.33 per cent. are learning. Of the females 98.86 per cent. are illiterate. Canarese is the mother-tongue of 21,057, Tulu that of 83,475, Hindustani that of 2,213, Konkani that of 13,129, Maráthi that of 11,956 and Malayálam that of 148,132. Classified by means of subsistence the population consists of 114,939 landholders and tenants, 47,451 agricultural labourers, 44,400 general labourers, 32,058 traders, 4,015 weavers. 16,719 other artisans and 21,077 'others.'

The area of ryotvári land in the taluk is 659,100 acres, and The land. that of minor inams is 1,400. Of the ryotwari land about 41,000 acres are under forest and 494,000 acres are not available for

Kásaragód.

The land.

CHAP. XIX. cultivation. Of the remainder 95,900 acres are in occupation, and the area available for extension of cultivation is thus 28,200 acres. The area cropped in 1892-93 was 90,600 acres of ryotwari land and 1,100 acres of minor inám, or about 0.33 of an acre per head of the population. Including the area cropped more than once the extent was 129,800 acres. Rice is the principal crop and is grown on nearly 101,400 acres. There are about 14,000 acres under orchard and garden produce, 969 acres under condiments and spices and 840 acres under tobacco. There were in that year 14.758 single pattás, of which 9,983 were for sums below Rs. 10. The normal land revenue of the taluk is Rs. 2,45,800, and the cesses charged on land revenue amount to Rs. 33,280.

The agricultural stock in the taluk is shown in the margin.

Bulls and bullocks	47,223
Cows	35,613
Male buffaloes	30,592
Cow buffaloes	5,099
Young stock	36,325
Sheep and goats	4,150
Ploughs	63,246
Carts	649

Interpreting ploughing cattle to mean bulls, bullocks and male buffaloes, there is one pair to every 3:47 acres in occupation; the district average being one pair to 3.60 acres; there are 15 cows and cow buffaloes to every

100 inhabitants against a district average of 18; and there are 31 sheep and goats to each 1,000 acres in occupation, the average for the district as a whole being 17.

Places of interest.

Kásaragód (kasara, wild buffalo, and kódu, peak): Population 5,943; taluk head-quarters; post office; travellers' bungalow; local fund hospital; sub-registrar's office; chatram; distance from Mangalore 27 miles. It is built on the Chandragiri river. When the country along the coast was divided by Mayura Varma into 64 sections under different Bráhman governors, this was one of the four centres. It formed the southernmost post of the ancient Tuluva kingdom, and was also the site of one of the mosques built in the ninth century by Chéramán Perumál, the ruler of Malabar, who became a convert to Muhammadanism. A fort built by Sivappa Náyak, when he subdued the petty Rájás of Tuluva, is now in total ruins.

Kumbla: A small port 19 miles south of Mangalore; population 2,620; police station; travellers' bungalow (local fund); chatram; distance from Kásaragód 9 miles, north-north-west. The town stands on a bold peninsula in a lagoon separated from the sea by a sand spit and communicating with it by a narrow channel, on which the village of Kannipuram is situated. It was once a considerable town, but now decayed. The Rájá of Kumbla, whose ancestors ruled the southern part of Tuluva and who is now a Government pensioner, resides at a small distance. 1514 Duarte Barbosa visited the port and recorded that he found

the people exporting a very bad brown rice to the Maldives in CHAP. XIX. exchange for coir. Early in the sixteenth century the port paid a KASABAGOD. tribute of 800 loads of rice to the Portuguese. After the capture Places of of Mangalore by Tippoo, the Rájá fled to Tellicherry, but returned interest. in 1799 when he had thoughts of asserting independence, but he soon submitted and accepted a small pension. There is a fort built by the Ikkéri Rájás. At the gate of this fort is an inscription in Canarese recording the erection of the fort by a Náyak.

Níléshwar or Nilakanta Ishwaram: Population 9,842, of whom 8,275 are Hindus and 1,567 Musalmans; post office; chatram; distance from Kásaragód 19 miles. It is the southernmost town of Canara and the old limit of Kéralam. It was formerly under a Chief belonging to the Kollatiri or Chirakkal family of Malabar until it was annexed by Sómasékhara Náyak of Bednore in 1737, after a struggle of twelve years in which the French and English took part. When the Bednoreans began to invade the Níléshwar territory, the Níléshwar Bájá was aided by the English who had a factory at Tellicherry. In 1737 a treaty was concluded by which the Bednoreans agreed not to advance south of the Vallarpatnam river, and the English obtained commercial advantages including a monopoly of the pepper and cardamoms in the portions of the Kollatiri dominions occupied by the Bednore people. The fort at Nileshwar, however, remained in the hands of the Rájá, and he allied himself with the French, who held the port on his behalf till 1761. By that time Bednore had fallen to Hyder and the Rájá remained in power at Níléshwar till the English annexed the country in 1799, when he submitted and accepted a pension.

Manjéshwar (mancha, bed-stead, and ishwara, lord): Population 2,608; travellers' bungalow (local fund); post office; local fund hospital; sub-registrar's office; port; distance from Mangalore 12 miles south, and from Kásaragód 16 miles north-northwest; situated at the mouth of a small stream on an inlet of the Arabian Sea. It is a large straggling town, the southern portion of which stands on a plain and the northern on a steep bank that overhangs the river. These two portions were held by the petty Jain Bangar Rájá and the Vittal Rájá respectively, until Tippoo hanged the former and forced the latter to take refuge with the English at Tellicherry. Manjéshwar was plundered by the pirates of Angria in 1755. In 1800 Buchanan found the Konkani merchants of Manjeshwar in a flourishing condition. old Jaina basti here.

Vittal: Population 2,834, of whom 2,310 are Hindus and 311 Musalmans; post office; sub-registrar's office; chatrams; CHAP. XIX. Kásaragód.

Places of interest.

distance from Mangalore 19 miles, and from Kásaragód 19½ miles, north-north-east. It is the family seat of the Vittal Heggades. During the Mysore ascendency the Heggade fled to Tellicherry, but returning after the death of Tippoo, he collected a number of followers and allied himself with Subba Rao who had set up a natural son of Tippoo as a pretender to the Mysore throne. Subba Rao was finally defeated in July 1800 by the tahsildar of Kadaba and the Vittal Heggade came to terms. The representative of the family now receives a small pension. The temple of Panchalingésvara is of great antiquity, but most of the present buildings are quite modern.

Chandragiri (chandra, moon, and giri, hill): Population 1,410, of whom 700 are Hindus and 710 Musalmans; distance from Mangalore 29 miles, and from Kásaragód 2 miles, south-southeast. It is a large square fort, situated high above the river on its southern bank. It was built, like the other forts, by Sivappa Náyak, the first prince of the house of the Ikkéri Rájás who established his authority in this part of Canara. The river on which it stands is shallow, but very wide, and formed the southern boundary of the ancient Tuluva kingdom. The Náyar and other females of the Kásaragód taluk of South Canara are prohibited from crossing this river.

Békal (bé, burning, and kallu, stone): Population 5,090; police station; travellers' bungalow; distance from Mangalore 34 miles, and from Kásaragód 7½ miles, south-south-east. It contains the largest and best preserved fort in the district, situated on headland running into the sea with fine bay towards the south. It was built by Sivappa Náyak of Bednore between 1625 and 1670 A.D. The fortifications are said to bear traces of European science. This tract was anciently under the Kadamba dynasty, and subsequently became part of Vijayanagar. On the destruction of the latter at Talikóta in 1565, it was seized by the Rájá of Bednore and gave its name to a sub-division of that kingdom. It fell to Hyder Ali in 1763, and, on the overthrow of Tippoo in 1799, was incorporated with the dominions of the East India Company. The present Kásaragód taluk was known as Békal for more than half a century.

Udiyávara (udaya, rising, and pura, town): Population 2,054, of whom 1,140 are Musalmans; post office; distance from Mangalore 9½ miles, and from Kásaragód 18 miles, north-north-east. It is a Máppilla village.

Hosdrúg (hosa, new, and drúg, fort, i.e., Pudiyakót as it is balled in Malabar): Population 4,581; deputy tahsildar's station; sub-registrar's office; local fund dispensary; travellers' bunga-

low (local fund); distance from Mangalore 41 miles, and from CHAP. XIX Kásaragód 15 miles, south. There is a large ruined fort built by Kásaragód. the Ikkéri Rájás. It occupies a fine rising ground, looks well at Places of a distance and commands a noble prospect. The bastions being interest. round, it must have been more capable of defence than the native forts in general, in which the defences are usually square.

Adúr: 17 miles east of Kásaragód. The village contains the remains of an old sculptured Siva temple, fabled to have been founded by Arjuna. It is said to have been repaired about 500 years ago.

Mádnúr or Kávu: 35 miles north-east of Kásaragód; travellers' bungalow on the main read. There is an old fort in the village known as the fort of the 'Mayilarasu.'

Maddúr: 4 miles north-north-east of Kásaragód; private chatram where meals are supplied free. This village also contains a large fort known as the fort of the 'Mayilarasu.'.

MANGALORE TALUK.

Mangalore is the most central of the coast taluks, the Canara Mangalore. sea-board to the south of it being about 55 miles in length, and that to the north 58 miles. It is bounded on the north by Udipi; description. on the east by Mysore and the Uppinangadi taluk; on the south by Kásaragód; and on the west by the sea. It has about 25 miles of sea-board from 3 miles north of Múlki to 5 miles south of the Nétravati, but its average length is not so much. Its greatest breadth is about 32 miles, and it is nowhere less than 27. Its estimated area is about 620 square miles.

There are three rivers in the taluk, of which the Nétravati Rivers. and Gurpur are alone of any importance. They are all navigable to a short distance from their mouths.

The country presents the usual appearance, a low-lying plain soil. near the coast extending up the larger river valleys, two of which are especially large, and behind that laterite hills and plateaux rising to a height of nearly 400 feet chequered with numberless streams and valleys, and out-crops of boulders or even ridges of granite gneiss. Still further inland come the spurs from the gháts in the north-eastern part of the taluk which alone approaches the gháts. The laterite plateaux in the Mangalore taluk are very extensive and bare, notably the Múdabidri plain which extends for many miles and is of a beautiful vivid green in the wet season, but burnt up and arid looking in the hot weather.

CHAP. XIX.
MANGALORE.
Forests.

The forests of the taluk are not very extensive, but large quantities of firewood and cashew-nuts are grown in the kumaki lands adjoining the cultivated fields. The natural forest of the taluk, except in the interior, has been coppiced so constantly for leaves for manure, that in many places it has disappeared altogether; but, as a consequence of this, special care is now bestowed on the conservancy of the 'kumakis' and hill-slopes adjoining cultivation, so that nowhere, except on the large upland plains above referred to, is there any absence of trees to refresh the eye in the driest weather.

Communi-

There are altogether 164 miles of road in the taluk distributed as follows:—

	MILES.
(1) Road No. 1, Sampaji ghát road	15
(2) Road No. 4, Kodekal ghát road	21
그렇게 살아가는 마시다. 그렇게 하고 그리고 하는 것이 되었다. 그리고 살아 살아 있다는 아니는 아니는 아니라 있다. 나는 아니는 아니는 아니는 아니는 아니는 아니는 아니는 아니는 아니는 아니	30
(4) Road No. 10, from Múlki to Múdabidri	15
(5) Road No. 10-A, from Múdabidri to Beltangadi	20
(6) Road No. 10-B, to Múlki bazaar	1
(7) Road No. 11, from Bantvál to Múdabidri	16
(8) Road No. 22, Coast road	20
(9) Road No. 23, from Mangalore to Mulki vid Bajpé	16
(10) Road No. 24, Mangalore road circuit	10
Total	164

The first three roads are the three main lines of through communication of the district and are under the management of the district board. The Sampaji ghát road or the trunk line from Mangalore to Bangalore vià Mercara enters the taluk at the Nétravati river about 15 miles from Mangalore. Shortly before this the Kodekal ghát road starts from it keeping to the northern bank of the Nétravati and enters the Uppinangadi taluk 21 miles further on. The Agumbi ghát road leaves Mangalore in a northeasterly direction and runs 30 miles towards Karkal via Gurpur and Mudabidri before leaving the taluk. The old avenues of Vateria Indica (Dúpada mara) on the road are still very fine in places. Of the roads under the taluk board, probably the most important is the road from Mangalore to Mulki on the coast. The old coast road was practically abandoned under the policy adopted by the Public Works Department in South Canara, and an inland road 24 miles in length against 17 by the old coast road was made viá Bajpé joining the road from Múdabidri to Múlki 16 miles from Mangalore. This road (No. 23) is now much used. but it is circuitous and very hilly, and in addition to the large

Gurpúr river it is crossed by two streams at Yekkar and Katila CHAP. XIX. which are too small for ferries and yet cannot be bridged except at a MANGALORE. large outlay. The taluk board, therefore, determined to re-open Communicathe old coast road with some modifications; this is only 18 miles in tions. length and passes through a much more populous country. There are two large ferries instead of one, but the disadvantage is more than counterbalanced by the shortness and ease of the route.

The water communications in connection with roads are as follows :--

- (1) Road No. 1, from Mangalore to Pane-Mangalore, and Road No. 4, from Mangalore to Bantvál . . 18
- (2) Road No. 5, from Mangalore to Gurpúr ..

These lines of water communication, especially the former, are very extensively used for rice and all other articles of traffic from Múlki. Coffee consigned to European firms or native firms working on the European method always comes all the way by road, but that consigned to ordinary native traders frequently comes by water from Pane-Mangalore and Bantvál. There is also communication by backwater along the coast from Mangalore to Panambúr, a distance of 5 miles, and from Mukka to Múlki or Hejmádia, 6 miles.

The taluk lies in the head-quarter division. The chief local Administrarevenue officer is the tahsildar (salary Rs. 225). He is also a magistrate, but the bulk of the magisterial work is performed by the stationary sub-magistrate at Mangalore. The taluk forms two police divisions, each under an inspector, and is divided into thirteen police-station charges. In respect to civil actions it is situated within the jurisdiction of the district munsif of Mangalore. The number of villages, including the town of Mangalore, is 309, and all but one are inhabited.

The population of the taluk in 1891 was 278,908, of whom Population. 137,166 were males and 141,742 females. Hindus number 201,287, Musalmans 30,670, Christians 41,645 and Jains 5,242. The population has increased by 11.99 per cent. since 1881 and there are now 450 persons to the square mile. The number of occupied houses is 48,982 and there are on an average 5.69 inmates to each house. Of the male population 85.09 per cent. are illiterate, 10.27 per cent. can read and write and 4.64 per cent. are learning. Of the females 97.82 per cent. are illiterate. Canarese is the mother-tongue of 11,256 persons, Tulu that of 168,166, Konkani that of 58,839, Malayalam that of 27,689 and Hindustani that of 6.116. Classified by means of subsistence the population consists of 120,861 landholders and tenants, 24,840

CHAP. XIX.
[MANGALORE.]
Population.
The land.

agricultural labourers, 51,854 general labourers, 34,442 traders, 1,911 weavers, 19,626 other artisans and 25,374 persons of various other callings.

The area of ryotwári land in the taluk is 395,200 acres, and that of minor inams is 1,556. There are neither whole inams nor zemindáris. Of the ryotwári land about 36,800 acres are under forest and 167,100 acres are not available for cultivation. Of the remainder 115,300 acres are in occupation, and the area available for extension of cultivation is thus 76,100 acres. The area cropped in 1892-93 was 101,900 acres of ryotwári land. Including the area cropped more than once the extent was 164,900 acres. There were in that year 11,585 single pattás, of which 4,981 were for sums below Rs. 10. The normal land revenue of the taluk is Rs. 3,59,500, and the cesses charged on land revenue amount to Rs. 42,400.

The agricultural stock in the Government villages is shown in

Bulls and bullocks	35,309
Cows	34,750
Male buffaloes	48,97
Cow buffaloes	3,45
Young stock	34,75
Sheep	370
Goats	2,84
Ploughs	69,93
Carts	1,05

the marginal table. Interpreting ploughing cattle to mean bulls, bullocks and male buffaloes, there is one pair to every 4.28 acres in occupation, the district average being one pair to 3.60 acres; there are 14 cows and cow buffaloes to every 100

inhabitants against a district average of 18; and there are 28 sheep and goats to each thousand acres in occupation, the average for the district as a whole being 17.

Products.

As in Canara generally rice is the staple product, while cocoanut plantations abound on the coast and areca-nut plantations in the villages adjoining the gháts and to some extent in the villages draining the laterite plateaux which spread from the gháts to within a few miles of the coast line. In the best rice lands two and even three crops are grown, but in many of them after a first crop of rice there is grown one of some kind of gram, or of beans, dholl or gingelly. Ragi is grown mainly on hill-sides unsuited for ordinary rice cultivation, and in some parts of the taluk, especially within 10 or 15 miles from Mangalore, this kind of cultivation is becoming extensive and includes considerable quantities of turmeric and chillies and different kinds of vegetables, besides a certain amount of hill-rice. Sugar-cane is grown here and there, all over the taluk, in rice lands which do not lie too low to admit of drainage.

Mangalore: Population 40,922, of whom 23,398 are Hindus, 7,584 Musalmans and 9,845 Christians. Mangalore or Kodiál

Places of interest.

Bandar is the head-quarters of the Collector, Judge, tahsildar, CHAP. XIX. deputy tahsildar, district munsif and district registrar; post and MANGALORE. telegraph station; travellers' bungalow; hospital and chatram Places of maintained by the municipality; sea-port; municipal town; interest. distance from Madras 370 miles west, from Bombay 418 miles Mangalore is said to have been the seat of one of the four Bráhman governors appointed in the eighth century, and of a Wodear appointed by Harihara Ráya of Vijayanagar in 1336, but in old days, it seems to have been the commercial rather than the political capital of Tuluva or South Canara. In 1342 it was visited by Ibn Batuta, who stated that there were merchants of Persia and Yemen there then, and in 1514 it was described by Barbosa as a very large town, peopled by Moors and Gentiles who shipped rice and pepper. He was struck by the beauty of the site and the fine buildings. Vasco de Gama blockaded the Mangalore river in 1524, and it was taken by the Portuguese in 1526, Franciscan friars beginning to preach in the same year in the town and its neighbourhood. Within a few years the Portuguese made themselves masters of the whole coast and levied tribute from all the ports, the amount contributed by Mangalore being two thousand four hundred loads of rice and one thousand of oil. Although temporarily taken by the Portuguese and partly occupied by them afterwards, the native town continued to be held by the Bangar whose family had been recognized as underlords by the Vijayanagar dynasty. When the Ikkéri dynasty came into power the position of the Bangar as an ally of the Portuguese became critical, and he had to flee to Kásaragód, but he recovered his position when the Ikkéri ruler became friendly with the Portuguese in 1631, and remained in power until the final fall of the family in the time of Hyder. A Portuguese factory was established at Mangalore in 1670, and in 1695 the town was burned by the Arabs in retaliation for the restrictions imposed by the Portuguese on Arab trade. Early in the eighteenth century the Portuguese were expelled by the Ikkéri or Bednore ruler, but they came to terms in 1714 when a Portuguese factory was again established. The fort of Mangalore, which is now in ruins, was built by Basavappa Náyak of the Ikkéri dynasty between 1739 and 1754. In 1760 Mangalore was taken possession of by Hyder immediately after the fall of Bednore, and he at once established naval dockyards and an arsenal. In 1768 it was captured by an English expedition from Bombay, but abandoned shortly afterwards. It was again captured in 1791 and besieged by Tippoo in 1793. After a heroic defence under Colonel Campbell it surrendered on the 30th January 1794, and the fort was

MANGALORE.

Places of interest.

CHAP. XIX. demolished by order of Tippoo Sultan. The town again came into the hands of the English after the fall of Seringapatam in 1799. Since that time the only disturbance has been during the Coorg insurrection in 1837, when the rebels entered the town and burnt the cutcherry. The East India Company held a monopoly from the Rájá of the magazines here for sandalwood growing on the Mysore hills.

> The town is picturesque, clean and prosperous. The native houses are laid out in good streets, and the European quarter is particularly pleasant. Like all the towns on the Malabar coast. Mangalore is buried amid groves of cocoanut palms. Situated on the backwater formed by the convergent mouths of the Nétravati and Gurpúr rivers, it has water on three sides of it. Large vessels cannot cross the bar into the harbour; but Arabian bagalas and country craft enter in considerable numbers. The lighthouse is merely a harbour light 11 miles east-north-east of the river entrance. The Mangala Dévi temple, which gives its name to the town, is an old one. There is a large native Roman Catholic population with a European Bishopric, several churches, a convent and two colleges. A few miles north is found a deposit of fine porcelain clay closely resembling that of which Sevres ware is formed. The Basel Lutheran Mission has its head-quarters here. and has done much good in teaching trades and industries. Good cloth is woven at their establishment; the making of roof tiles, printing and binding are also taught.

> The great article of export is rice, more than three-fourths of the whole produce being sent to Muscat, Goa, Bombay and Malabar. Betel-nut, coffee, black pepper, sandalwood, cassia and turmeric are also exported. Salt is not manufactured, but is imported from Bombay and Goa. Raw silk for the use of the manufacturers above the ghats and sugar are imported from Bengal and China, and oil and ghee from Surat. In Hyder's reign the principal merchants were Máppillas and Konkanis. Many men of property have, however, come since then from Surat, Cutch, Bombay and other places to the north. These persons are chiefly of the Bania caste, but there are also some Pársis. The vessels employed in trade generally belong to other ports. The town is a healthy one, but good water is only procurable in the dry season, and even then it is always more or less impregnated with irons from the laterite through which it percolates. The small tanks in the neighbourhood are seldom dry, though in the hot weather the surface of the water becomes covered with slimy vegetable matter.

> Aldangadi: The family seat of the old Jain chief known as the Ajalar.

Mudbidri or more correctly Múdabidri: Population 921; CHAP, XIX. police station; local fund dispensary; sub-registrar's office; MANGALORE chatram for native travellers; distance from Mangalore 18 miles. It is now a hamlet composed of portions of Prantiya and interest. Potigi villages though once a populous town. Next to Kárkal Múdabidri is the most important Jaina town in South Canara, and the temple of Chandranáth is the finest temple of the kind in the district. It is the family seat of the old Jaina chief known as the Chowtar, of whom a representative still remains and draws a small pension from Government. Being an important Jain centre, it is visited by pilgrims even from Guzerât and other distant places. There are eighteen bastis or Jaina temples, and a math occupied by one of the chief gurus of that sect. The bastis illustrate the attempt to copy wooden forms which characterizes all Hindu stone-workings, especially those on the west coast. There are also tombs of Jain priests, lofty erections of several storeys, and interesting as being some of the few Hindu tombs in Southern India. The rájá's old palace has an insignificant appearance, as the roof is made only of thatch, but the stone sculptures inside are of a superior order. There is a handsomely carved wooden roof. The walls are carved with paintings. There is an old bridge near the Jain bastil illustrating the efforts of Hindus to bridge a stream.

Ullal: Population 5,703; post office; distance from Mangalore 2 miles. It is situated on the south bank of the Nétravati river, and was formerly the seat of a petty Jain prince. Of all the petty states into which Canara was divided in ancient times. the kingdom of Ullál appears from its ruins to have taken the lead in royal pomp and splendour. The following monuments of her ancient glory may be mentioned:—(1) The ruins of a fort or palace about a mile or so to the south of the ferry, to the left side of the road leading to Manjéshwar; (2) the temple of Sómnáth, not far from the above ruins, containing beautiful sculptures after the pattern of Italian art, a knowledge of which is supposed to have been spread among the natives by a Florentine artist who visited India about the fifteenth or sixteenth century; (3) the fort of Uchil about 6 miles to the south of the ferry—one of the strongholds, probably of the Queen of Ullál; (4) the palace of Manel supposed to be the ordinary residence of the queen-situated beyond Gurpur-noted for its manufacture of earthen pots, whence perhaps the name. Other monuments of less importance, such as ruined temples and neglected slabs, are also found-all which tend to show that Ullál was once a powerful state able to

¹ For a description of the bastis and tombs, see pp. 87-91 of vol. i of this Manual.

Places of interest.

CHAP. XIX. hold its own against the encroachments of neighbouring states. MANGALORE. In the seventeenth century the Queen of Ullál sided with the Ikkéri and Bednore family against the Bangar of Mangalore.

> Bólúr: Population 1,256; situated on the banks of the Gurpur river. It is a suburb of Mangalore containing a battery constructed by Tippoo Sultan of granite rock.

> Bantvál: Population 3,551, of whom 2,395 are Hindus, 785 Musalmans and 154 Christians; police station; post office; deputy tahsildar's station; local fund hospital; sub-registrar's office; distance from Mangalore 14 miles, east. It is built on the northern bank of the Nétravati river which is so far navigable by boats. The river bed is here encumbered with masses of hornblende rock, containing mica and garnets, syenite and a beautiful pegmatite, with flesh-coloured crystals of felspar. During the war with Tippoo the town of Bantvál was partially destroyed by the Rájá of Coorg, who carried off half the inhabitants as prisoners. It was formerly the head-quarters of a taluk of the same name. The taluk was dismembered in 1852, and merged in the present Mangalore taluk. possesses considerable traffic, being an entrepôt for the produce of Mysore on its way to the coast and vice versa. There is a wealthy temple dedicated to Venkatramana, owned by Konkani Bráhmans, in which a car festival is celebrated annually in the month of March.

> Kadre: Village; population 1,677; distance from Mangalore 2½ miles, north-east. It has an old temple dedicated to Sri Manjunáda and a Jógi math. Just above the temple are nine tanks which are considered very sacred, and in which all pilgrims to the holy shrine invariably bathe before entering the temple.

> Farangipet: A hamlet, being portions of Arkúla and Púda villages; distance from Mangalore 7 miles, east. It lies on the north bank of the Nétravati river and has a travellers' bungalow, a police station, a military encamping ground and an old church and convent built during the Portuguese settlement. It is so called from its having formerly been chiefly inhabited by the Konkani Christians who were invited to reside here by the princes of the house of Ikkéri. It was formerly a large town, but was destroyed by Tippoo who carried away its inhabitants.

> Gurpúr: A hamlet of Mullúr village; distance from Mangalore 8 miles, north-east; situated on river of the same name; police station; travellers' bungalow. The rájá's palace, known as the 'matham' is an interesting building. The windows of the old zenana are elaborately pierced and carved.

> Mijár: Population 2,608; distance from Mangalore 13 miles, north-north-east. Gold has been found on a hill called Mundabetta in the neighbouring village of Yedapadavu.

Suratkal: Population 2,770; police station; private chatram; CHAP. XIX. distance from Mangalore 9 miles, north-north-west. It has a MANGALORE. temple on a high rock on the sea-shore. A car festival is annually Places of celebrated at the end of December, when there is a large gathering interest. of people from several adjoining villages.

Múlki (lit. pertaining to civil administration): Town consisting of Bápanád, Kasba bazaar and a portion of Mánambádi village; port; population 3,776; police station; sub-registrar's office; local fund dispensary; travellers' bungalow; chatram; distance from Mangalore 16 miles, north. It is situated on an inlet of the sea receiving the Sambavati. The water is too shallow to admit large vessels, but small fishing and coasting craft find shelter here. Opposite the mouth of the inlet is a group of islets known as the Múlki or Premeira rocks. The town was formerly the seat of a petty kingship subdued by the Bednore Rájá in the beginning of the seventeenth century. It has a considerable trade in rice, and is the seat of the Basel Mission. Here the New Testament was translated into Tulu. A weekly fair is held every Saturday. There is a Jaina basti, besides two Hindu temples belonging to the Konkani and Shivalli Bráhmans. respectively.

Yénúr: Population 421; distance from Mangalore 24 miles. east-north-east. It is one of the few remaining Jaina villages,now very small, but must once have been a flourishing and splendid centre, judging from the remains of palaces and buildings, and the colossal statue which still stands there. The statue is placed on an elevated terrace on the south bank of the Gurpur river, which is here about 20 yards broad and runs over a rocky bed. The terrace rises about 50 feet above the river-bed, and the image is enclosed by a square wall 7 or 8 feet high, with massive covered entrance, forming a good-sized quadrangle, in the midst of which it stands, on a stone plinth of two stages placed on a platform 4 or 5 feet in height. It is 35 feet high and is one of the three as yet known. The natives say that this statue was cut and wrought at a spot 3 or 4 miles distant from where it now stands and on the other side of the river; if so its transport to its present site must have been a marvel of engineering skill. Both this and the Karkal image are traditionally said to have been sculptured by Jakkanachári, a kind of Hindu Weyland the Smith, to whom remarkable works in stone are popularly ascribed: probably he was a workman of extraordinary excellence. He is traditionally said to have wrought the statue at this place with a single hand, one being disabled; hence its lesser size.2

For a description of the statue, see p. 37 of the Indian Antiquary vol. v.

CHAP. XIX. Mangalore.

Places of interest.

There are two or three Jaina temples in the village, of no great size, nor specially distinguished for architecture or sculpture. Adjoining one of these temples is a small building or sacellum containing the twenty-four Tirthankaras in a row, all of the same size, about 2 feet high, cut in black stone, each under a horse-shoe shaped arch elaborately wrought from the same material. The building containing them is poor and mean with a thatched roof, but is entered by a doorway quite a wonder of exquisite and beautiful workmanship set in a common rough stone wall. In front of the temple stands a wonderful Jain pillar.³ There are in all eight Jaina and one Bráhmanical temple. A car festival is celebrated annually in the principal temple early in March. The statue is anointed once in every sixty years. The last abhishékam (or anointing ceremony) was performed in March 1887.

UDIPI TALUK.

General description.

THE Udipi taluk lies between the Coondapoor and Mangalore taluks, the former being to the north and the latter to the south of it. It is bounded on the west by the sea and on the east by Mysore, the boundary line being the summit of the gháts though the line comes nearly half-way down the slopes here and there. The sea-board is about 30 miles long and the average length may be taken as the same, the average breadth being about 26 miles. The estimated area is 787 square miles.

Rivers.

The taluk has three large rivers, the Sitanadi and the Swarnanadi, which join to form the backwater at Hangarkatta, and the Udayávar river which falls into the sea at Malpe after skirting the coast for several miles.

Soil.

These backwaters and estuaries with their fertile banks and islands covered with cocoanut or sugar-cane plantations form an important feature of the coast line of the taluk, and the broad valleys of the rivers stretch far inland with many square miles of rice fields. The usual laterite hills and plateaux with their myriads of valleys and boulders of granite gneiss make up the landscape until we come to the forest-clad spurs from the gháts. The outcrops of gneiss are particularly marked in the neighbourhood of Kárkal and the south-eastern part of the taluk generally.

Forests.

The hills except those near the ghats have been to a very large extent cleared of even scrub jungle by cultivators, but near

For a detailed description of the doorway and pillar, reference should be made to pp. 38-39 of vol. v. of the Indian Antiquary.

the coast special attention is now being paid to 'kumakis' and CHAP. XIX. privately conserved jungles on the slopes near cultivation.

Udder.

The road system of the taluk is fairly complete and most of Communicathe roads are well laid out and kept in good order. There are tions. eleven of them with a total length of 177 miles as follows:—

크게 됐다. 내용적인 그 시간하는데 내가 보고 있는데 하고 하면 하는데 하다니까?	MILES
(1) Road No. 5, Agumbi to Mangalore (port)	28
(2) Road No. 5-A, from Mudrádi to Surabella.

(10) Road No. 22, from Coast road to Malukal	. 3
(11) Road No. 22-A, from Coast road to Maluka	1
Kotaurs	. 1
Total	. 177

The first road is part of the main line of through communication from Shimoga to Mangalore and is kept up by the district board. The rest are all under the taluk board. Of the latter the most important is road No. 14, which leaves the Agumbi ghát road a few miles from the foot of the ghát and runs vià Perdúr and Hiriadka through Udipi to the port of Malpe, with branch lines aggregating 6 miles in length from Perdúr and Hiriadka to Bajpé, whence there is water communication with the port of Hangarkatta. From Hebri near Hospet, on road No. 14, another road (No. 16) runs to Kokkarni from which there is also water communication by another river with the port of Hangarkatta, and road No. 17 puts the Agumbi ghát into communication with the port of Coondapoor. As in the other taluks the value of the coast road is more appreciated than it used to be and a good deal of money is now being spent in improving it. More than half the length in the Udipi taluk is now in very good condition for carttraffic. Road No. 13 joins road No. 16 at Hiriadka and puts the sub-magistrate's station of Kárkal in communication with the headquarters of the taluk. The remaining roads are only of local The old avenues of the dúpada-mara or Vateria Indica are particularly fine, and those on road No. 5 near Karkal. and on an old road, now abandoned, from Bárkúr to Sankaranáráyana in communication with the ghát road to Bednore, are specially worth mentioning.

Unifi.
Communications.

CHAP. XIX.

The water communications in connection with the roads are as follows, and are useful for boats with a burthen of about 6 tons:—

			뭐하면 하는 것으로 가는 시간에 무지 않는 것도 했다.	MILES.
(1) I	Road No.	16, H	langarkatta to Kokkarni	. 10
(2) F	Road No.	14, H	angarkatta to Bajpé	16
(3) I	Road No.	22, M	Talpe to Udayávar	6
			: 이 경기 : 이 전 기계 전 경기 기계 기계 기계 기계 기계 기계 기계 기계 기계 기계 기계 기계 기계	
			Total	. 82

In addition to these there is communication by backwater along the coast from Káph to Udayávar, a distance of 5 miles, and from Kalliánpúr viá Hangarkatta to Mánúr, a distance of 10 miles. The Malpe river is also navigable for small rowing boats during the rainy season to Súda, 10 miles above Udayávar, and by a branch to Matti, 5 miles from Udayávar. Boats can also be taken up a branch of the Hangarkatta river to a distance of 3 miles, above Kalliánpúr in the dry season, and 15 miles in the wet, but the strength of the current then renders navigation hardly feasible.

Administration. The taluk lies in the Head Assistant Collector's division. The chief local revenue officer is the tahsildar (salary Rs. 225), but the bulk of the magisterial work is performed by the stationary submagistrate of Udipi. The taluk forms a single police division under an inspector and is divided into seven police-station charges. In respect to civil actions it is situated within the jurisdiction of the district munsif of Udipi. The number of villages, including the town of Udipi, is 261, and of these all but two are inhabited.

Population.

The population of the taluk in 1891 was 253,717, of whom 118,727 were males and 134,990 females. Hindus number 227,041, Musalmans 7,125, Christians 17,251, and Jains 2,300. The population has increased by 6.86 per cent. since 1881, and there are now 322 persons to the square mile. The number of occupied houses is 45,116 and there are on an average 5.62 inmates to each house. Of the male population 86.03 per cent. are illiterate, 10.04 per cent. can read and write and 3.93 per cent. are learning. Of the females 99.32 per cent. are illiterate. Canarese is the mother-tongue of 69,536 persons, Tulu is that of 126,700, Malayálam that of 2,746, Konkani that of 36,964, Maráthi that of 11,756, and Hindustani that of 4,061. Classified by means of livelihood the population consists of 148,528 landholders and tenants, 8,402 agricultural labourers, 51,824 general labourers, 17,189 traders, 877 weavers, 15,442 other artisans and 11,455 others.

The land.

The area of ryotwari land in the taluk is 498,100 acres and that of minor inams is 5,534 acres. There are neither whole inams nor zemindaris. Of the ryotwari land about 105,000 acres are under forest and 265,600 acres are not available for cultivation. Of the

remainder, 83,500 acres are in occupation and the area available CHAP. XIX. for extension of cultivation is thus 44,000 acres. The area cropped in 1892-93 was 75,600 acres of ryotwari land and 5,400 acres of The land. minor inám, or about 0.32 of an acre per head of the population. Including the area cropped more than once the extent was 126,700 Rice is the principal crop and is grown on nearly 103,800 There are about 7,100 acres under orchard and garden acres. produce and 1,100 acres under gingelly. The dry crops including the pulses occupy an extent of 13,000 acres. The normal land revenue of the taluk is Rs. 3,37,000 and the cesses charged on land revenue amount to Rs. 49,000.

The agricultural stock in the taluk is shown in the marginal

Bulls and bullocks	43,98
Cows	45,62
Male buffaloes	46,20
Cow buffaloes	5,05
Young stock	42,60
Sheep	10
Goats	1,21
Ploughs	70,36
Carts	1,58

table. Interpreting ploughing cattle to mean bulls, bullocks and male buffaloes there is one pair to every 2.99 acres in occupation, the district average being one pair to 3.60 acres; there are 20 cows and cow buffaloes to every 100 inhabitants against a district

average of 18; and there are 10 sheep and goats to each one thousand acres in occupation, the average for the district as a whole being 17.

As elsewhere in Canara the staple produce is rice, a crop of dry Products. grain or pulses being grown as a second crop on lands which are fairly good, but not sufficiently so to permit of a second rice crop being raised. The most common of these are the different kinds of gram, dholl, beans and gingelly. Sugar-cane is also grown to a small extent near the coast, where there are also the usual cocoanut gardens. Areca-nuts are grown in the shaded valleys near the ghats. The forest products have nothing specially distinctive about them, except that amongst timber trees kiralbóghi (Hepea parviflora) is more abundant than further south, and amongst minor products cinnamon trees are the most important.

Udipi: Population 7,272, of whom 5,916 Hindus, 574 Musalmans and 781 Christians; taluk head-quarters; post and telegraph office; travellers' bungalow (local fund); distance from Mangalore 33 miles, north. Within the town are comprised parts of Badagabittu, Múdanidambúr, Puttúr and Shivalli villages. It is considered the most sacred spot in the Canarese country, and its shrine of Krishna is much frequented by pilgrims from Mysore. The importance of Udipi dates from the twelfth century when the temple of Krishna is said to have been founded by Mádhaváchárya himself, who set up in it an image of Krishna originally made by Arjuna, and obtained by him from a vessel wrecked on the coast

HDIPI.

Products.

CHAP. XIX. of Tuluva. He also placed in it three sáligráms presented to him by the sage Vyása. There are also eight ancient maths, each with a swami, each of whom in turn presides over the Krishna temple for two years. At the change of swami the pariyayi festival occurs. The temples are rude buildings, but roofed with copper, which must have cost much money.

Places of interest.

Kárkal: Population 4,115; deputy tahsildar's station; post-office; sub-registrar's office; port; travellers' bungalow (local fund); distance from Mangalore 26 miles, and from Udipi 18 miles, east-south-east. It was once a populous Jaina town containing many Jain statues and temples. It rose into importance as the seat of the Bairasu Wodears, who probably made Kárkal their capital when Bárkúr was made over in 1336 to a governor appointed by Harihara Ráya of Vijayanagar. The famous colossal statue of Gumta Ráya was set up by this family in 1431, and in the middle of the sixteenth century the last raja is said to have died leaving seven daughters, who divided the kingdom amongst them and were each known by the title of Baira Dévi. The daughter of the Baira Dévi who married Itcheappa Wodear of Gairsappa is said to have re-united the kingdom in her person, as her aunts died without issue and the family was extinguished when Bárkúr fell to Sivappa Náyak in the beginning of the seventeenth century. There is a small lake here. The village is the centre of a considerable rice trade. The most remarkable Jain remains in the district are found at Kárkal or its immediate neighbourhood, and are described in the first volume of this Manual.

Bárkúr: Population 951; distance from Udipi 9 miles, north. Bárkúr is the traditional capital of Tuluva. It now stands about 3 miles inland, but was probably originally a coast town on the common estuary of the Sitanadi and Swarnanadi, the little port of Hangarkatta, which now stands there, being also known as the port of Bárkúr. When Bráhmans were introduced into Tuluva in the eighth century, Bárkúr was one of the places at which a Bráhman governor is said to have been appointed; and it is also one of the towns in which a mosque is said to have been built in the ninth century by the adherents of Chéramán Perumál, the ruler of Malabar, who had then been converted to Muhammadanism. Later on, it was the local capital of the Hoysal Ballál dynasty, being probably held for them by one of the Humcha family, represented afterwards by the Bairasu Wodear of Kárkal. local rulers appear to have secured independence after the conversion from Jainism to Bráhmanism of the Hoysal Ballál king Vishnuvardhana, and about 1250 A.D. it was held by a ruler named Bhútál Pándiya, who appears to have made his power exceptionally felt and who has been confused by some with the CHAP. XIX. Bhútál Pándiya of traditions to whom is ascribed the introduction of the 'Alayasantána' or 'sister's son' system of inheritance. Places of The local chiefs retained independence at Bárkúr till 1336, when interest. the kingdom was made over to Harihara Ráya of Vijayanagar, who appointed a local 'Ráyaru.' The old fort at Bárkúr, of which the ruins now remain, is said to have been built by Harihara Raya. In 1506 the Vijayanagar dynasty was still in power and a Keladi Basavappa arasu was appointed Ráyaru, thus paving the way to the supremacy of the Keladi or Ikkéri family. About this time the Portuguese power made itself felt at the port of Barkur, which for some time paid an annual tribute of one thousand loads of rice. In 1560 another of the Keladi family, which by that time had moved to Ikkéri, obtained the underlordship of Bárkúr and Mangalore with the title of Sadásiva Náyak, and the family became independent when Vijayanagar was taken and sacked by the Musalmans in 1565. Venkatappa Náyak, who was reigning at Bárkúr when Basrúr was ceded to Bíjapúr by Baira Dévi, resented the cession, and by 1608 he had captured and slain Baira Dévi and almost extirpated the Jains throughout the province of Bárkúr. A Muhammadan governor was appointed at Bárkúr after the capture of Nagar by Hyder Ali, but its importance seems to have ceased with the fall of the local Jain influence, and at the present day it is not even the head-quarters of a taluk. Traces of the great fort built by Hari Hara Ráya, about 1370, still exist, as also the tanks and part of the walls of an old palace. Ruins of Buddhist temples abound, and inscriptions testify that in the fourteenth century Bárkúr was the seat of the viceregal government of the Rájá of Vijayanagar. Among the sculptures, one representing a procession of armed men, bearing a striking resemblance in equipments and general appearance to the Greek soldiery, and another of a centaur, deserve special mark. The present town possesses some trade in brass and copper utensils.

Kalliánpúr: Population 5,582; distance from Mangalore 38 miles. Kalliánpúr (literally 'the auspicious town') is not the Kalliána of the Periplus as was at one time supposed, but it is probably the Kalliána mentioned by Cosmos Indico-pleustes early in the sixth century as the seat of a Christian Bishop. It is said to have been the birthplace of Madhavacharya, the Vaishnavite Hindu reformer, about 1199 A.D.4 In 1678 the Portuguese were

LL

CHAP. XIX. allowed to establish a factory at Kallianpur, but their position was not on a satisfactorily firm footing till 1714. There is now a Roman Catholic Church at Kalliánpúr, of which the pastor and congregation have refused to recognize the recent arrangement under which the jurisdiction of the Archbishop of Goa was completely withdrawn from South Canara. It was for some time the capital of the Kalachurya king Bijjala.

> Chitpádi: It is a small village containing 421 inhabitants. The name Chitpádi means a 'small jungle.' It is the family seat of one of the most influential of the Brahman Ballals of South Canara. Their connection with the locality is supposed to date from the advent of the Brahmans with Mayura Varma in the eighth century.

> St. Mary Isles: These are a group of islands lying a little to the north of the port of Malpe and are so called on account of a cross set up by Vasco de Gama who visited them in 1498.

> Alevur: Population 1,283, of whom 1,281 are Hindus. It is one of the sixteen cities mentioned in Bhútál Pándiya's 'Alayasantána law. '

> Padubidri: Population 2,183; distance from Mangalore 19 miles. It is the seat of a Ballal family still extant.

> Varanga: Population 959. It is the seat of a Jaina rájá of the Heggade family. There is also an old Jaina temple.

> Balisávira: The name signifies a town of 1,000 (sávira) families (bali). It is a mágané or sub-division of a taluk comprising a large area of forty-six villages. According to a tradition 1,000 families of Nandávar following the Alayasantána law of inheritance once lived in this area.

> Brahmávar: Population 1,084, distance from Mangalore 40 miles, north. This village, which lies on the route from Mangalore to Bednore, was the former residence of the tahsildar of the Bárkúr taluk.

> Mudrádi: Population 1,897; distance from Mangalore 51 miles, north. It was the seat of a Ballal chief under the Jain Chowtar rájá.

> Mannárghur: It is a small coast village situated 25 miles north-west of Mangalore. There is an old fort here.

> Nellikar: Population 939. Good granite stones are quarried in the neighbourhood.

> Nidambúr: Population 1,645. It gives its name to a Ballál family in Canara.

Súda: It is a small village 12 miles south-east of Udipi. CHAP. XIX. There is an old Subramanya temple here, in which a car festival is celebrated annually.

Places of

Súral: Population 355. It is a small village situated 39 interest. miles north of Mangalore. It was the seat of a Jain rájá.

Malpe: Population 3,125. This is the port of Udipi and the best port in the district. The anchorage is sheltered by the island of Daria Bahadurghur. There is a fixed light close to the entrance of the river, visible to a distance of 5 miles.

UPPINANGADI TALUK.

UPPINANGADI is the only inland taluk of the district. It is UPPINANGADI. bounded on the north and east by Mysore; on the south by Coorg General and the Kásaragód taluk; and on the west by Kásaragód and description. Mangalore. On the north the summit of the ghats forms the boundary, but on the east and south, where the line of the ghats is intersected by great valleys, the boundary line comes right to the foot of the hills to cross the valleys. The greatest length of the taluk from north to south is about 50 miles, and the greatest breadth about 33. The estimated area is 951 square miles.

Though the taluk has nothing to compare with the alluvial Soil. tracts of the coast taluks, yet the great valleys of the Kumardhári and Nétravati and their principal tributaries are extremely fertile and afford a pleasant contrast to the bare hills of the western portions of the taluk and the otherwise continuous forest of the western and southern portions.

Forest is the characteristic feature of the scenery of the taluk, Forests. and over a considerable area there is nothing else to be seen. The forests are good and extensive though they have been overworked since the beginning of the century. Teak abounds in many localities, and other good timber trees are common, but minor products are neither so varied nor so abundant as might be expected from the extent of the forests. Cardamoms, however, are grown in a semi-cultivated manner more largely than in any other taluk of the district both in private and government forests. At one time pepper was grown very extensively, but the cultivation has never recovered since the pepper trade was destroyed by the heavy duties imposed by Tippoo on its export.

The main lines of communications with the countries above the Communicagháts lie through the Uppinangadi taluk which is, therefore,

CHAP. XIX. better provided with roads than might be expected of it, seeing Uppinangadi. that it is very sparsely populated. The roads are:—

4 14	s (Million

Road No.	9, from Puttúr to Beltanga	di		19
Road No.	9-A, from Beltangadi to	Nagore	and	
Malodi	••	•	••	16
		TOTAL		173
	Bisli _i	ghát road	• •	32
		Total	••	205

The Sampaji ghát road is the main line of communication open, at all seasons, between Mangalore and the Eastern Coast viâ Mercara, Mysore and Bangalore, and is much used by the coffee traffic from Coorg. It is bridged throughout and is always kept in good order with an annual maintenance allotment of Rs. 200 a mile. The Manjarabád ghát road leads to the important coffee districts of Manjarabád and Hássan. It was an expensive line to make owing to the number of streams to be bridged, but it is now bridged throughout with one large iron bridge at Keabbinále and several minor ones at different places along the road, besides numerous masonry bridges and culverts. The Kodekal ghát road leads to Chiknagar and the coffee district of Kádúr. The statistics of land trade show it to be the most important line of communication with Mysore, and the toll receipts indicate that the traffic on it is even larger than on the main lines through Coorg. It was once bridged throughout with laterite and wood, but unfortunately the wooden superstructures, and in some cases the laterite pieces and abutments did not last long. The old bridge at Beltangadi has recently been replaced by a fine granite and iron structure, and it is hoped that iron girders will soon be placed on the masonry at Nidgal and Mundaji, which is still in capital order. They are both large bridges, however, the former having 11 spans of 30 feet, and it will not be easy for the district board to find the requisite funds. The Bisli ghát road lies between the Manjarabád and Kodekal ghát roads and joins the former near Uppinangadi. It is useful for the coffee and other traffic from South Mysore and North Coorg, and has been made from a grant given by Government at the request of the Mysore State. Road No. 8-A, from Subramanya to Jalsur, is a fair-weather road in connection with the road from Jalsúr to the port of Kásaragód. It is not much used and little is spent on it. Road No. 9 from

Puttur to Beltangadi connects the southern part of the Uppinan- CHAP. XIX. gadi taluk with the northern taluks and is a very useful road. Uppinangani. Road No. 9-A, from Beltangadi to Nagore and Malodi, goes through Communicathe fertile valley of Bangadi and has several village roads as tions. feeders. After Nagore it is used only by a few people going to the Kudre Mukh and passing over Samse and Kalasa in Mysore by a path from the Malodi saddle, after which there is a private road 4 miles in length to the Kudre Mukh.

Though Uppinangadi is an inland taluk, the only big river in the district runs through it, and it is therefore not absolutely without water communication. In the hot season the Nétravati is navigable the whole distance from Uppinangadi to Mangalore, a distance of about 38 miles, of which nearly half lies within the limits of the Uppinangadi taluk. From Uppinangadi the Nétravati is navigable in the rainy season for 12 miles further to Dharmastala.

The taluk lies in the General Duty Deputy Collector's division. Administrawhose head-quarters are at Puttur. The chief local revenue officer is the tahsildar (salary Rs. 175). He is also a magistrate, but the bulk of the magisterial work is performed by the stationary sub-magistrate of Uppinangadi and the deputy tahsildar and sub-magistrate at Beltangadi. There are 279 villages, and of these all but two are inhabited. The taluk is divided into two police divisions (at Beltangadi and Puttúr) which are again sub-divided into fourteen police-station charges. In respect to civil actions it is situated within the jurisdiction of the district munsif of Puttur.

60,614 were males and 58,193 females. Hindus number 105,494, Musalmans 8,613, Christians 2,569 and Jains 2,128. The population has increased by 7.65 per cent. since 1881, and there are now 125 persons to the square mile. The number of occupied houses is 21,503, and there are on an average 5.53 inmates to each house. Of the male population 90.89 per cent. are illiterate, 6.96 per cent. can read and write and 2.15 per cent. are learning. Of the females 99.52 per cent. are illiterate. Canarese is the mothertongue of 16,857 persons, Tulu that of 81,490, Malayalam that

The area of ryotwari land in the taluk is 605,800 acres, and The land. that of minor inams is 2,829. There are neither whole inams nor

of 8,647, Konkani that of 6,321, Maráthi that of 3,303, and Hindustani that of 1,724. Classified by means of subsistence the population consists of 67,230 landholders and tenants, 15,517 agricultural labourers, 21,309 general labourers, 4,274 traders, 427

weavers, 4,664 other artisans and 5,386 others.

The population of the taluk in 1891 was 118,807, of whom Population.

The land.

CHAP. XIX. zemindáris. Of the ryotwári land about 331,400 acres are under Uppinangadi. forest and 168,700 acres are not available for cultivation. Of the remainder 79,700 acres are in occupation, and the area availabe for the extension of cultivation is thus 26,000 acres. The area cropped in 1892-93 was 57,400 acres of ryotwari land and 1,400 acres of minor inám, or about 0.49 of an acre per head of the population. Including the extent cropped more than once, the extent was 92,400 acres. Rice is the principal crop and is grown on nearly 82,000 acres. There are about 1,200 acres under gingelly and 500 acres under ragi. There were in that year 5,696 single pattas, of which 1.789 were for sums below Rs. 10. The normal land revenue of the taluk is Rs. 1,43,000, and the cesses charged on land revenue amount to Rs. 21,000.

The agricultural stock in the taluk is shown in the margin.

Bulls and bullocks	36,597
Cows	25,040
Male buffaloes	21,047
Cow buffaloes	4,675
Young stock	32,439
Sheep and goats	1,525
Ploughs	37,694
Carts	579

Interpreting ploughing cattle to mean bulls, bullocks and male buffaloes, there is one pair to every 3.98 acres in occupation, the district average being one pair to 3.60 acres; there are 25 cows and cow buffaloes to every 100 inhabitants against a district

average of 18; and there are 13 sheep and goats to each thousand acres in occupation, the average for the district as a whole being 17.

Products.

Even here rice is the staple product, the place next in importance being taken by areca-nuts, of which there are many plantations in the valleys adjoining the spurs of the ghats. plantations are, of course, less common than in the coast. Ragi is grown more extensively than in most of the other taluks. A crop of some kind of gram, beans, dholl or gingelly is grown after a first rice crop on soils which are fairly good, but do not possess water-supply for a second rice crop. A small quantity of tobacco is grown in some villages of the Sulia Mágané, and a little ginger, turmeric and chillies here and there throughout the taluk.

Places of interest.

Puttur: Population 3,745, of whom 2,714 are Hindus, 514 Musalmans and 487 Christians; post office; police station; taluk head-quarters; distance from Mangalore 25 miles. Owing to the Coorg insurrection, which first broke out at Bellare, 16 miles south-east, troops were stationed here from 1837 till the introduction of the mofussil police in 1860.

Uppinangadi: Population 1,612; police station; post office; distance from Mangalore 27 miles. Until recently it was the head-quarters of the taluk. An old temple, which stands at the CHAP. XIX. confluence of the Nétravati and Kumardhári, is held very sacred. Uppinangadi. It was, however, attacked in 1800 by Subba Rao and the Vittal Places of Heggade, but successfully held by the tahsildar of Kadaba.

Bailangadi: Population 1,979; the name is derived from Canarese bailu, plain and angadi, shop. It is the family seat of an old Jain chief, the Múlar.

Bellare: Population 619; post office. The Bellare Mágané was ceded to Coorg in 1768 by Hyder Ali and resumed by Tippoo in 1775, but was again ceded by the English in 1799. It was finally resumed when Coorg was annexed in 1834. A force which left Kumbla under Colonel Jackson in that year to co-operate in the invasion of Coorg from the Mysore side was stopped by a stockade near Bellare.

Kadaba: Population 1,025; police station; post office; distance from Mangalore 43 miles. Kadaba is said to have been the seat of one of the four Bráhman governors appointed for Tuluva in the eighth century. Owing to its situation it was frequently devastated during the Coorg invasions in the eighteenth century. The tahsildar of Kadaba did good service against recalcitrants in 1800.

Sisila: Population 255; distance from Mangalore 45 miles. Sisila is now a small jungle village, deriving importance only from its ancient temple, but is believed to have been at one time, probably about the eleventh century, the Tulu capital of the Humcha family, who afterwards became the Bairasu Wodears of Kárkal.

Bangadi: Police station; post office. It was the seat of one of the local officers of the Vijayanagar government from the times of Harihara Ráya.

Jamálabád: It was formerly called Narasimhangadi (Narasimha's place), and the present fort was built on its ruins by Tippoo Sultan in honour of his mother Jamal Bee. It is a small town at the foot of a high rock forming the terminus of a long spur from the Kudre Mukh. The capabilities of the rock for fortification were noticed by Tippoo who built a fort on the top of it in 1794. It was captured by the British in 1799, but was soon after surprised and taken by Timma Náyak on behalf of a Mysore pretender. It was recaptured by the British in June 1800.

Subramanya or Pushpagiri: It is a small village below the ghats containing 440 inhabitants; police station; distance from Mangalore 55 miles. It is one of the principal seats of serpent worship in South India, and there is also an old and famous temple

Places of interest.

CHAP. XIX. dedicated to Siva. Although it is a Saivite temple, it holds a Uppinangadi. sáligrám deposited there by the Vaishnavite reformer Mádhaváchárya. A large cattle fair is held here during the annual festival in November and December. Garnets are found in the Kumardhári river 3 miles from the temple. The ascent to the hill is difficult, but can be managed on foot in about three hours. On the summit are many ancient stone cairns.

Dharmastala: It is a place of pilgrimage in the village of Mallarmadi; population 1,325, of whom 1,128 are Hindus; police station; distance from Mangalore 37 miles. There is a wellendowed temple dedicated to Manjunada. The Dharmastala játra, or illumination festival, is celebrated for four days in November or December and the Nadávali festival once in twelve years for thirteen days. The Heggade of Dharmastala rendered good service to the British at Jamalabad and against the Vittal Heggade in 1800.

Amara and Sulia: The Amara and Sulia Máganés were added to Coorg by the Bednore rulers in 1730 and resumed by Tippoo in 1775. They were again ceded by the British on the annexation of Canara and remained attached to Coorg until the deposition of the rájá in 1834.

Kudre Mukh: The Kudre Mukh is one of the three peaks of the Western Ghauts ranging from 6,173 to 6,207 feet above sealevel, and it forms the sanitarium of South Canara. The name is said to be derived from its appearance as a conspicuous land-mark to sailors. It can be ascended from the west by a bridle-path. There are two bungalows on the Mysore side of the ridge about 500 feet below the top.

Bisley or Bisli: This pass was formerly of importance as connecting Mangalore with Seringapatam, but fell into disrepair, and was long practicable for pack-bullocks only. It was recently opened as a fair-weather road and continued to Uppinangadi. As being the shortest route to Subramanya where a great annual fair is held, the cattle-breeders on the other side use this road. The village stands at one end of the pass on the road from Bangalore to Mangalore.

Chármadi: This pass, also known as the Boon ghát or Coffee ghát, was opened in 1864, and now it is one of the main lines for wheeled traffic, specially for coffee transport, between Mangalore and Mysore. The village of the name contains 700 inhabitants and is 42 miles east-north-east from Mangalore.

CHAPTER XX.

LIST OF COLLECTORS AND JUDGES.

CHAP. XX. It is necessary to explain, with reference to the following list of Collectors of Canara, that the province originally consisted of the two districts of North Canara (now in the Bombay Presidency) and South Canara, except the máganés of Amara and Sulia, which then belonged to Coorg. Major Munro was Collector of the whole province, but after he left it was divided into two divisions, and Mr. Ravenshaw was appointed Collector of the Southern division and Mr. A. Read of the Northern. These two districts consisted

of the following taluks (then called districts):

NORTHERN DIVISION.

	Tainks.		Taluks.
1.	Coondapoor.	5.	Sonda.
2.	Honavar.	6.	Banavási.
3.	Ankóla.	7.	Bilighi.
4.	Soopa.		
	젊은화휴는 취임하다 그 사이하는 것		

SOUTHERN DIVISION.

	Taluks.	Taluks.
1.	Bárkúr.	6. Puttúr.
2.	Balisavira.	7. Kadab.
3.	Málki.	8. Békal.
4.	Kárkal.	9. Vittal.
5.	Bantvál.	10. Mangalore.

On the 12th July 1804 a portion of the Southern division, bordering on Coorg, was ceded to the Rájá of that country as a reward for his services during the Mysore War. The revenue of the portion ceded was 24,011 Canteroy Pagodas, and the Rájá was required to present annually to the Company's Government the nominal tribute of an elephant.

In 1805 the Northern and Southern divisions were again amalgamated into a single Collectorate, and Mr. A. Read was placed in charge.

In 1834 the Rájá of Coorg was deposed and his country annexed to the British dominions. The portion of Canara which had been ceded to him in 1804 and the two máganés of Amara and Sulia, which he had obtained from the Bednore Rájá, were annexed to the district of Canara.

On the 16th December 1859 Canara was again divided into the two districts of North and South Canara; Mr. W. Fisher, the Collector, was appointed to the charge of the latter, which consisted of the four taluks of Mangalore, Békal (Kásaragód), Puttúr (Uppinangadi) and Udipi.

CHAP. XX.

On the 16th April 1862 the district of North Canara was transferred to the Bombay Presidency, but the taluk of Coondapoor was separated from it and annexed to South Canara. The boundary between the two districts was finally settled and defined by Notification of the Government of India, dated 16th September 1867, No. 4589, Home Department.

CHAPTER XXI.

TOMBS AND MONUMENTS.

CHAP. XXI. Tombs. THERE is only one tomb in the South Canara district which is of any historical interest. This tomb was erected in the year 1800 to the memory of Brigadier-General John Carnac and bears the following inscription.

"In memory of Brigadier-General John Carnac, formerly "Commander-in-Chief of the Forces at Bengal and afterwards "Second in Council at this presidency. He distinguished himself by the important victory gained over the Shah Zaddah in the "year 1761, and in both the stations his zeal for the public service, "integrity and disinterested conduct were equally conspicuous. "He died at Mangalore on the 29th November 1800. Aged "84 years."

The tomb is situated within the Government cemetery at Mangalore.

MONUMENTS.

There are a number of highly interesting monuments in the district. The most important of them, from an archæological and architectural point of view, are the remains of the ancient Jaina temples which appear to have been built about the fourteenth century A.D. A description of these will be found in the first volume of this Manual. Beyond the temple at Múdabidri are several tombs of Jain priests, lofty erections of several storeys, and interesting as being some of the only Hindu tombs in Southern India.

INDEX.

A

Abkári, offences, 179; present systems of, 176; revenue, 178. Adúr, 251. Agasas, number of, 21.
